Trends in Number of COVID-19 Cases and Deaths in the US Reported to CDC, by State/Territory

Reported in the CDC by State or Territory. Maps, charts, and tables include data reported by the CDC, updated daily by 8 pm ET

Select a state or territory: United States

View: Cases / Deaths

Metric: Daily trends / Total or 7-day

Bars represent daily totals. Trend line represents rolling averages. Hover over bars for more details. Use the buttons below to compare trends between areas with different population sizes.

Trends in Total and Cumulative Incidence Rate of COVID-19 Cases in the United States Reported to CDC, per 100,000 population

How many COVID-19 cases are there in your county?

View your county's data on the Tracking Map

View and Download COVID-19 Case Surveillance Public Use Data

Data will update as soon as they are received and processed by CDC. However, updates might not always be as always or reported daily.

Data Sources, References & Notes: The case classifications for COVID-19 is nationally notifiable disease, and data reported to the CDC National Notifiable Diseases Surveillance System (NNDSS) from jurisdictions in the United States, including 50 states, the District of Columbia, and 3 territories, and 2 cities, beginning on January 5, 2020. However, there is some variation in how jurisdictions report these case classifications. More information about the case surveillance data can be found on the Data & Analytics page of the COVID-19 Response.

Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial health departments to the Centers for Disease Control and Prevention (CDC) since January 21, 2020, with the exception of persons reported to the United States from the Diamond Princess cruise ship, persons who were repatriated to the United States from Wuhan, China, persons who were in Hubei, China, and persons who were repatriated to the United States, Japan, and the Republic of the Marshall Islands. Counts for United States territories and cities include probable COVID-19 cases and deaths. Counts for NYC and New York State are shown separately. Data for New York State exclude NYC. Rate per 100,000 population is based on the 2019 population estimates from the National Center for Health Statistics. Increasing the 7-day average mean deaths, CDC calculates the number of cases or deaths each day by calculating the difference in cumulative counts reported by the state from the day before. Historical data are not typically updated retroactively, however, from time to time, CDC may make adjustments to the cumulative counts to account for updates retro-dating the data. See source reporting for details on why retro-dating of data occurs.

The map can be modified to show cases and deaths per 100,000 people in the last 7 days, total new cases and deaths in the last 7 days, total cases and deaths since January 21, 2020, and the 7-day average mean of new cases and deaths (rounded to the nearest ten). Per 100,000 people in the last 7 days are calculated as the 7-day average mean of new cases or deaths (current) divided by 7, providing daily deaths for 7-day average mean deaths. Data are from the U.S. Census Bureau, Population Division, Annual Estimates of Resident Population for Counties: April 1, 2010 to July 1, 2019 released on March 26, 2020 (CO-EST2019-ANNRES).

Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial health departments to the Centers for Disease Control and Prevention (CDC) since January 21, 2020, with the exception of persons repatriated to the United States from the Diamond Princess cruise ship, persons who were repatriated to the United States from Wuhan, China, persons who were in Hubei, China, and persons who were repatriated to the United States, Japan, and the Republic of the Marshall Islands. Counts for United States territories and cities include probable COVID-19 cases and deaths. Counts for NYC and New York State are shown separately. Data for New York State exclude NYC. Rate per 100,000 population is based on the 2019 population estimates from the National Center for Health Statistics. Increasing the 7-day average mean deaths, CDC calculates the number of cases or deaths each day by calculating the difference in cumulative counts reported by the state from the day before. Historical data are not typically updated retroactively, however, from time to time, CDC may make adjustments to the cumulative counts to account for updates retro-dating the data. See source reporting for details on why retro-dating of data occurs.

On 10 December, Texas reported 177,589 historical counts of probable cases with dates between 1 November and 10 December. This caused the number of new cases in both Texas and the U.S. during this time period and corresponding rolling averages to reflect this big rolling average of new cases.
