Wastewater Surveillance

COVID-19: Wastewater Surveillance

Communities can track the presence of SARS-CoV-2, the virus that causes COVID-19, in their wastewater. Wastewater data can provide an early warning on COVID-19 spread. To learn more about this surveillance, visit the Wastewater Surveillance Dashboard.

Monitoring Wastewater Surveillance Data

Wastewater surveillance for COVID-19 is a rapidly developing field. State, tribal, local, and territorial (STLT) jurisdictions participating in the National Wastewater Surveillance System (NWSS) submit testing data to CDC. CDC then standardizes and interprets these data and presents them in the COVID Data Tracker. How to read and interpret wastewater data from NWSS is frequently data are reported to CDC and to public health department.

Wastewater data are meant to be used with other surveillance data to inform public health actions. Learn more about wastewater data by exploring each of the charts and maps. To see a map of which SARS-CoV-2 variants is the most prevalent at each wastewater sampling site, see Explore Wastewater Data: Summary of Variant Surveillance.

About the Data

Maps, charts, and data provided by CDC, updates Thursdays by 8pm ET. This represents all participating laboratories reporting to the NWSS. Wastewater surveillance data are reported from samples from the Water Quality Portal (WQP). Samples from the WQP may include samples that can represent all or part of a "sewershed" which is the area contributing wastewater to a wastewater treatment plant. All wastewater samples are composite samples. Composite samples, grab samples, and wastewater samples are collected from sewer systems to communicate the presence of SARS-CoV-2 in a community. Wastewater surveillance data are reported as gene copies per liter of wastewater and are the result of a complex laboratory process and are not a direct quantitative measure of a specific number of SARS-CoV-2 virus particles.

Wastewater Metric Chart

This chart shows how much more levels have changed (increased and decreased) over time at wastewater sites across the United States. It shows the percent of sites in each category of increasing or decreasing levels, and the total number of sites with valid data.

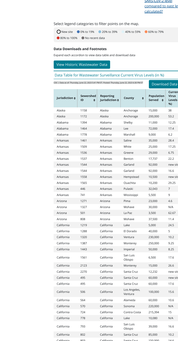
The percent change metric shows whether wastewater levels have increased or decreased at sites over the last 15 days:

- Blue categories (Large decrease (-100%), Decrease (-99% to -10%)): Virus levels decreased at these sites in the last 15 days.
- Yellow category (Stable (-9% to 9%)): Virus levels stayed about the same at these sites in the last 15 days.
- Orange and red categories (Increase (10% to 99%), Large increase (100% or more)): Virus levels increased at these sites in the last 15 days.

The chart shows the overall percent of sites that were in each category over time since January 1, 2021. If more area on the chart is shaded light or dark blue, it means virus levels were decreasing at more sites at that point in time. If more area on the chart is shaded red or orange, it means virus levels were increasing at more sites at that point in time. Changes in the last 15 days metric may be affected by how many wastewater plants were collecting wastewater samples, the black line shows the number of sampling sites with available data for each date.

Note: This chart does not show overall levels of SARS-CoV-2 in wastewater.

Percent of sites in each percent change category over time, United States*



*The darker bar on the right side of the chart highlights the most recent 2 weeks, which may be subject to reporting delays. The actual number of sites reporting during these 2 weeks will likely increase as historical data are added.

Reset Selections

Time Period: Jun 05, 2023 – Jun 19, 2023

Map Type: Percent Change | Percent Sites Stable

Metric:

- Percent change in virus levels in wastewater by site
- Percent change in the last 15 days
- Percent of wastewater samples with detectable virus

Other Layers:

- Sites with no recent data
- Sites that started sampling after 12/1/21

Current virus levels in wastewater by site

This metric shows whether SARS-CoV-2 levels at a site are currently higher or lower than past historical levels at the same site. We means virus levels are higher than all or most of the past levels at that site, and the highest they have been at the site. Public Health Actions include increasing levels of the virus in wastewater over time and use these data to help make public health decisions.

Note: Sites began collecting data at different times. Sites that began collecting data more recently, such as in 2021, may not have enough data to compare with ongoing data or are before December 1, 2021. The data history for these new sites is not long enough to reflect the same surges as the other sites.

Select target categories to filter points on the map.

Decreased (-99% to -10%) | Stable (-9% to 9%) | Increased (10% to 99%) | Large increase (100% or more) | Not enough data

monitor their health. Find information on what to consider when implementing a wastewater-based disease surveillance system.

Is there wastewater sampling in my community?

New sampling sites are being added over time as health departments begin sampling and reporting wastewater surveillance data. Some communities not represented on this dashboard may be conducting wastewater surveillance. If you would like to know if wastewater surveillance is happening in your community, contact your health department or local government. At this time, CDC does not release the names of the wastewater treatment plants or zip codes where sampling sites are located. However, information on the counties served by the wastewater sampling sites is provided.
