COVID-19 Forecasts: Cases

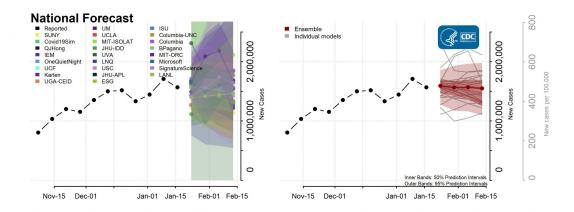

Updated Jan. 20, 2021

Print

Interpretation of Forecasts of New Cases

- This week, CDC received forecasts of new reported COVID-19 cases over the next 4 weeks from 25 modeling groups that were included in the ensemble forecasts.
- This week's national ensemble predicts that 1,100,000 to 2,000,000 new cases will likely be reported in the week ending February 13, 2021.
- The state- and territory-level ensemble forecasts predict that over the next 4 weeks, the number of new reported cases per week will likely decrease in 1 jurisdiction, which is indicated in the forecast plots below. Trends in numbers of future reported cases are uncertain or predicted to remain stable in the other states and territories.

National Forecasts

- The figure shows the number of new COVID-19 cases reported nationally in the United States each week from November 7, 2020 to January 16, 2021 and forecasted new cases over the next 4 weeks, through February 13, 2021.
- Models make various assumptions about the levels of social distancing and other interventions, which may not reflect recent changes in behavior. See model descriptions below for details.

State & County Forecasts

State-level and county-level forecast figures show observed and forecasted new COVID-19 cases in each location. Each forecast uses a different scale due to differences in the numbers of COVID-19 cases occurring in each jurisdiction. To aid in comparisons between jurisdictions, the ensemble plot for each location has a second axis (in grey) that shows the expected number of cases per 100,000 people.

Additional forecast data and information on forecast submission are available at the COVID-19 Forecast Hub \square .

Forecast Inclusion and Assumptions

The forecasts included in the ensembles are displayed below. Forecasts are included when they meet a set of submission and data quality requirements, further described here: https://github.com/reichlab/covid19-forecast-hub#ensemble-model 🔼 .

The forecasts make different assumptions about social distancing measures. Additional individual model details are available here: https://github.com/cdcepi/COVID-19-Forecasts/blob/master/COVID-19_Forecast_Model_Descriptions.md 🖸 .

Intervention assumptions fall into one of three categories:

- These modeling groups make assumptions about how levels of social distancing will change in the future:
 - Columbia University (Model: Columbia)

 - Johns Hopkins University, Infectious Disease Dynamics Lab [] (Model: JHU-IDD)
 - University of California, Los Angeles ☐ (Model: UCLA)
- These groups assume that existing social distancing measures will continue through the projected 4-week time period:
 - Bob Pagano ☑ (Model: BPagano)
 - Columbia University and University of North Carolina (Model: Columbia-UNC)
 - IEM ☑ (Model: IEM)
 - Iowa State University ☐ (Model: ISU)
 - Johns Hopkins University, Applied Physics Lab ☐ (model: JHU-APL)
 - Karlen Working Group ☑ (Model: Karlen)
 - LockNQuay (Model: LNQ)
 - Los Alamos National Laboratory <a> ☑ (Model: LANL)
 - Massachusetts Institute of Technology, Institute for Data, Systems, and Society
 (Model: MIT-ISOLAT)

Massachusetts Institute of Technology, Operations Research Center ☑ (Model: MIT-ORC)
- Microsoft Al ☑ (Model: Microsoft)
 OneQuietNight ☑ (Model: OneQuietNight)
 Qi-Jun Hong
- Robert Walraven ☑ (Model: ESG)
 Signature Science
- State University of New York, Upstate Medical University ☑ (Model: SUNY)
 University of Central Florida (Model: UCF)
 University of Georgia Center for the Ecology of Infectious Diseases Forecasting Working Group (Model: UGA-CEID)
- University of Michigan ☑ (Model: UM)
 University of Southern California (Model: USC)
 The University of Virginia (Model: UVA) model makes both assumptions, combining different models.
¹ The full range of the prediction intervals is not visible for all state plots. Please see the forecast data for the full range of state specific prediction intervals.
