as soon as they are reviewed and verified, oftentimes before 8 pm ET. However, daily updates might be delayed due to delays in reporting.

References & Notes: The case classifications for COVID-19, a nationally notifiable disease, are described in an [an updated interim COVID-19 case definition](#) issued by the Council of State and Territorial Epidemiologists on August 5, 2020. However, there is some variation in how jurisdictions use case definitions. More information on how CDC collects COVID-19 case surveillance data can be found at [CDC's COVID-19 FAQ webpage](#).

based on aggregate counts of COVID-19 cases reported by state and territorial jurisdictions to the Centers for Disease Control and Prevention (CDC), with the exception of persons repatriated to the United States from Wuhan, China, and Japan. All displayed counts include confirmed COVID-19 cases and deaths. Counts for NYC and New York State are shown separately; data for New York State show total cases and deaths for the entire state. COVID-19 case and death data that are not available to CDC are denoted with an N/A. For aggregate state level data, CDC calculates the 7-day first recorded by day calculating the difference in cumulative counts reported by the state from the day before. Historical data are not typically available by the state. Therefore, the number of historical cases and deaths presented on CDC's website reflect the date the data was reported to CDC and the date the case or death was recorded in the historical case.

corresponding data table can be modified to show COVID-19 case and death trends for up to six states or territories. When daily cases of COVID-19 are displayed, the index date is when 10 average daily cases were first recorded. When daily deaths attributed to COVID-19 are displayed, the index day is when the first recorded. For both of these measures, the 7-day moving average of new cases or deaths (current day + 6 preceding days divided by 7) is used to smooth expected variations in daily counts since the index date.

cases or deaths of COVID-19 are displayed, the index date is when 100 total cases or deaths were first recorded. The trend line shows the number of days since the index date.

or death rates per 100,000 are displayed, the index date is when .01 average daily cases or deaths per 100,000 people was first recorded. The trend line shows the 7-day moving average of new cases or deaths per 100,000 people using the U.S. Census Bureau, 2019's [American Community Survey 1-year estimates](#) as the index date.

average case or death rates per 100,000 are displayed, the index date is when 0.3 total cases per 100,000 people was first recorded. The trend line shows the 7-day moving average of new cases or deaths per 100,000 people using the U.S. Census Bureau, 2019's [American Community Survey 1-year estimates](#) by the number of days since the index date.

on estimates are still used for American Samoa, Federated States of Micronesia, Guam, New York City, Northern Mariana Islands, Palau, and the U.S. Virgin Islands.

COVID-19 case numbers are validated through a confirmation process with each jurisdiction. COVID-19 case numbers reported on CDC COVID Data Tracker due to the timing of reporting and COVID Data Tracker updates, which may differ by up to 24 hours. Case counts may be continually revised as more records are received and processed. Not all jurisdictions report counts daily.

may increase COVID-19 case and death counts at different

appear as spikes. The process used for finding and confirming COVID

displayed by other sites may differ.
