Did you know you can find COVID-19 data for any county in the US?

Use COVID Data Tracker's County View tab

View and Download COVID-19 Case Surveillance Public Use Data

Data will update as it is received from jurisdictions, with frequency determined by each jurisdiction's reporting schedule. Records identified as probable cases or deaths are those that do not meet the national surveillance case definition criteria, but which are reported by public health officials as probable cases or deaths. These data are manually reviewed every day by checking the data against local government websites and media reports, and the case values are corrected as needed to reflect local government reports. Cases are based on date of report and not on date of symptom onset. Rates are calculated using the U.S. Census Bureau, 2019 Population Estimates and are updated daily.

The figure and accompanying table can be used to show total COVID-19 cases or deaths by county, by 14-day rate, or nationally, and looks at new cases and deaths in the last 7 days, last two weeks, and cumulatively.

Metro vs. Non-Metro classification type is an aggregation of the 6 National Center for Health Statistics (NCHS) Urban-Rural classifications, which are based on the Office of Management and Budget (OMB) 2013 county designations. Specifically, Large Central Metro and Large Fringe Metro counties include Metropolitan and Non-Core (Micropolitan) counties that are part of Large Metro areas, as defined by the 2013 NCHS Urban-Rural Classification Scheme for Counties. Urban/Rural Classification Scheme for Counties

All data are assessed on rates per 100,000 calculated as the number of cases or deaths per 100,000 people using the U.S. Census Bureau, 2019 Population Estimates. Counties are categorized into groups by their rates, and the groups are assigned colors. Counties with rates based on fewer than five deaths (e.g., upon initial reporting, household size, prison, long-term care, and health insurance status. Cut points were generated by using ranks and histograms and will change as the pandemic progresses.

COVID-19 Community Vulnerability Index (CVI) scores, which range from 0 to 1, are from the Social Determinants of Vulnerability (SVI) 2018 Database. Counties with scores in the top quartile (0.75 to 1.0) are considered to have high social vulnerability. Counties with scores in the bottom quartile (0 to 0.25) are considered to have low social vulnerability. Counties with scores in the middle two quartiles (0.25 to 0.75) are considered to have medium social vulnerability. For CCVI and SVI scores were generated based on median and categorized as Low (0-0.333), Moderate (0.334-0.666), or High (0.667-1).
