## United States COVID-19 Cases and Deaths by State

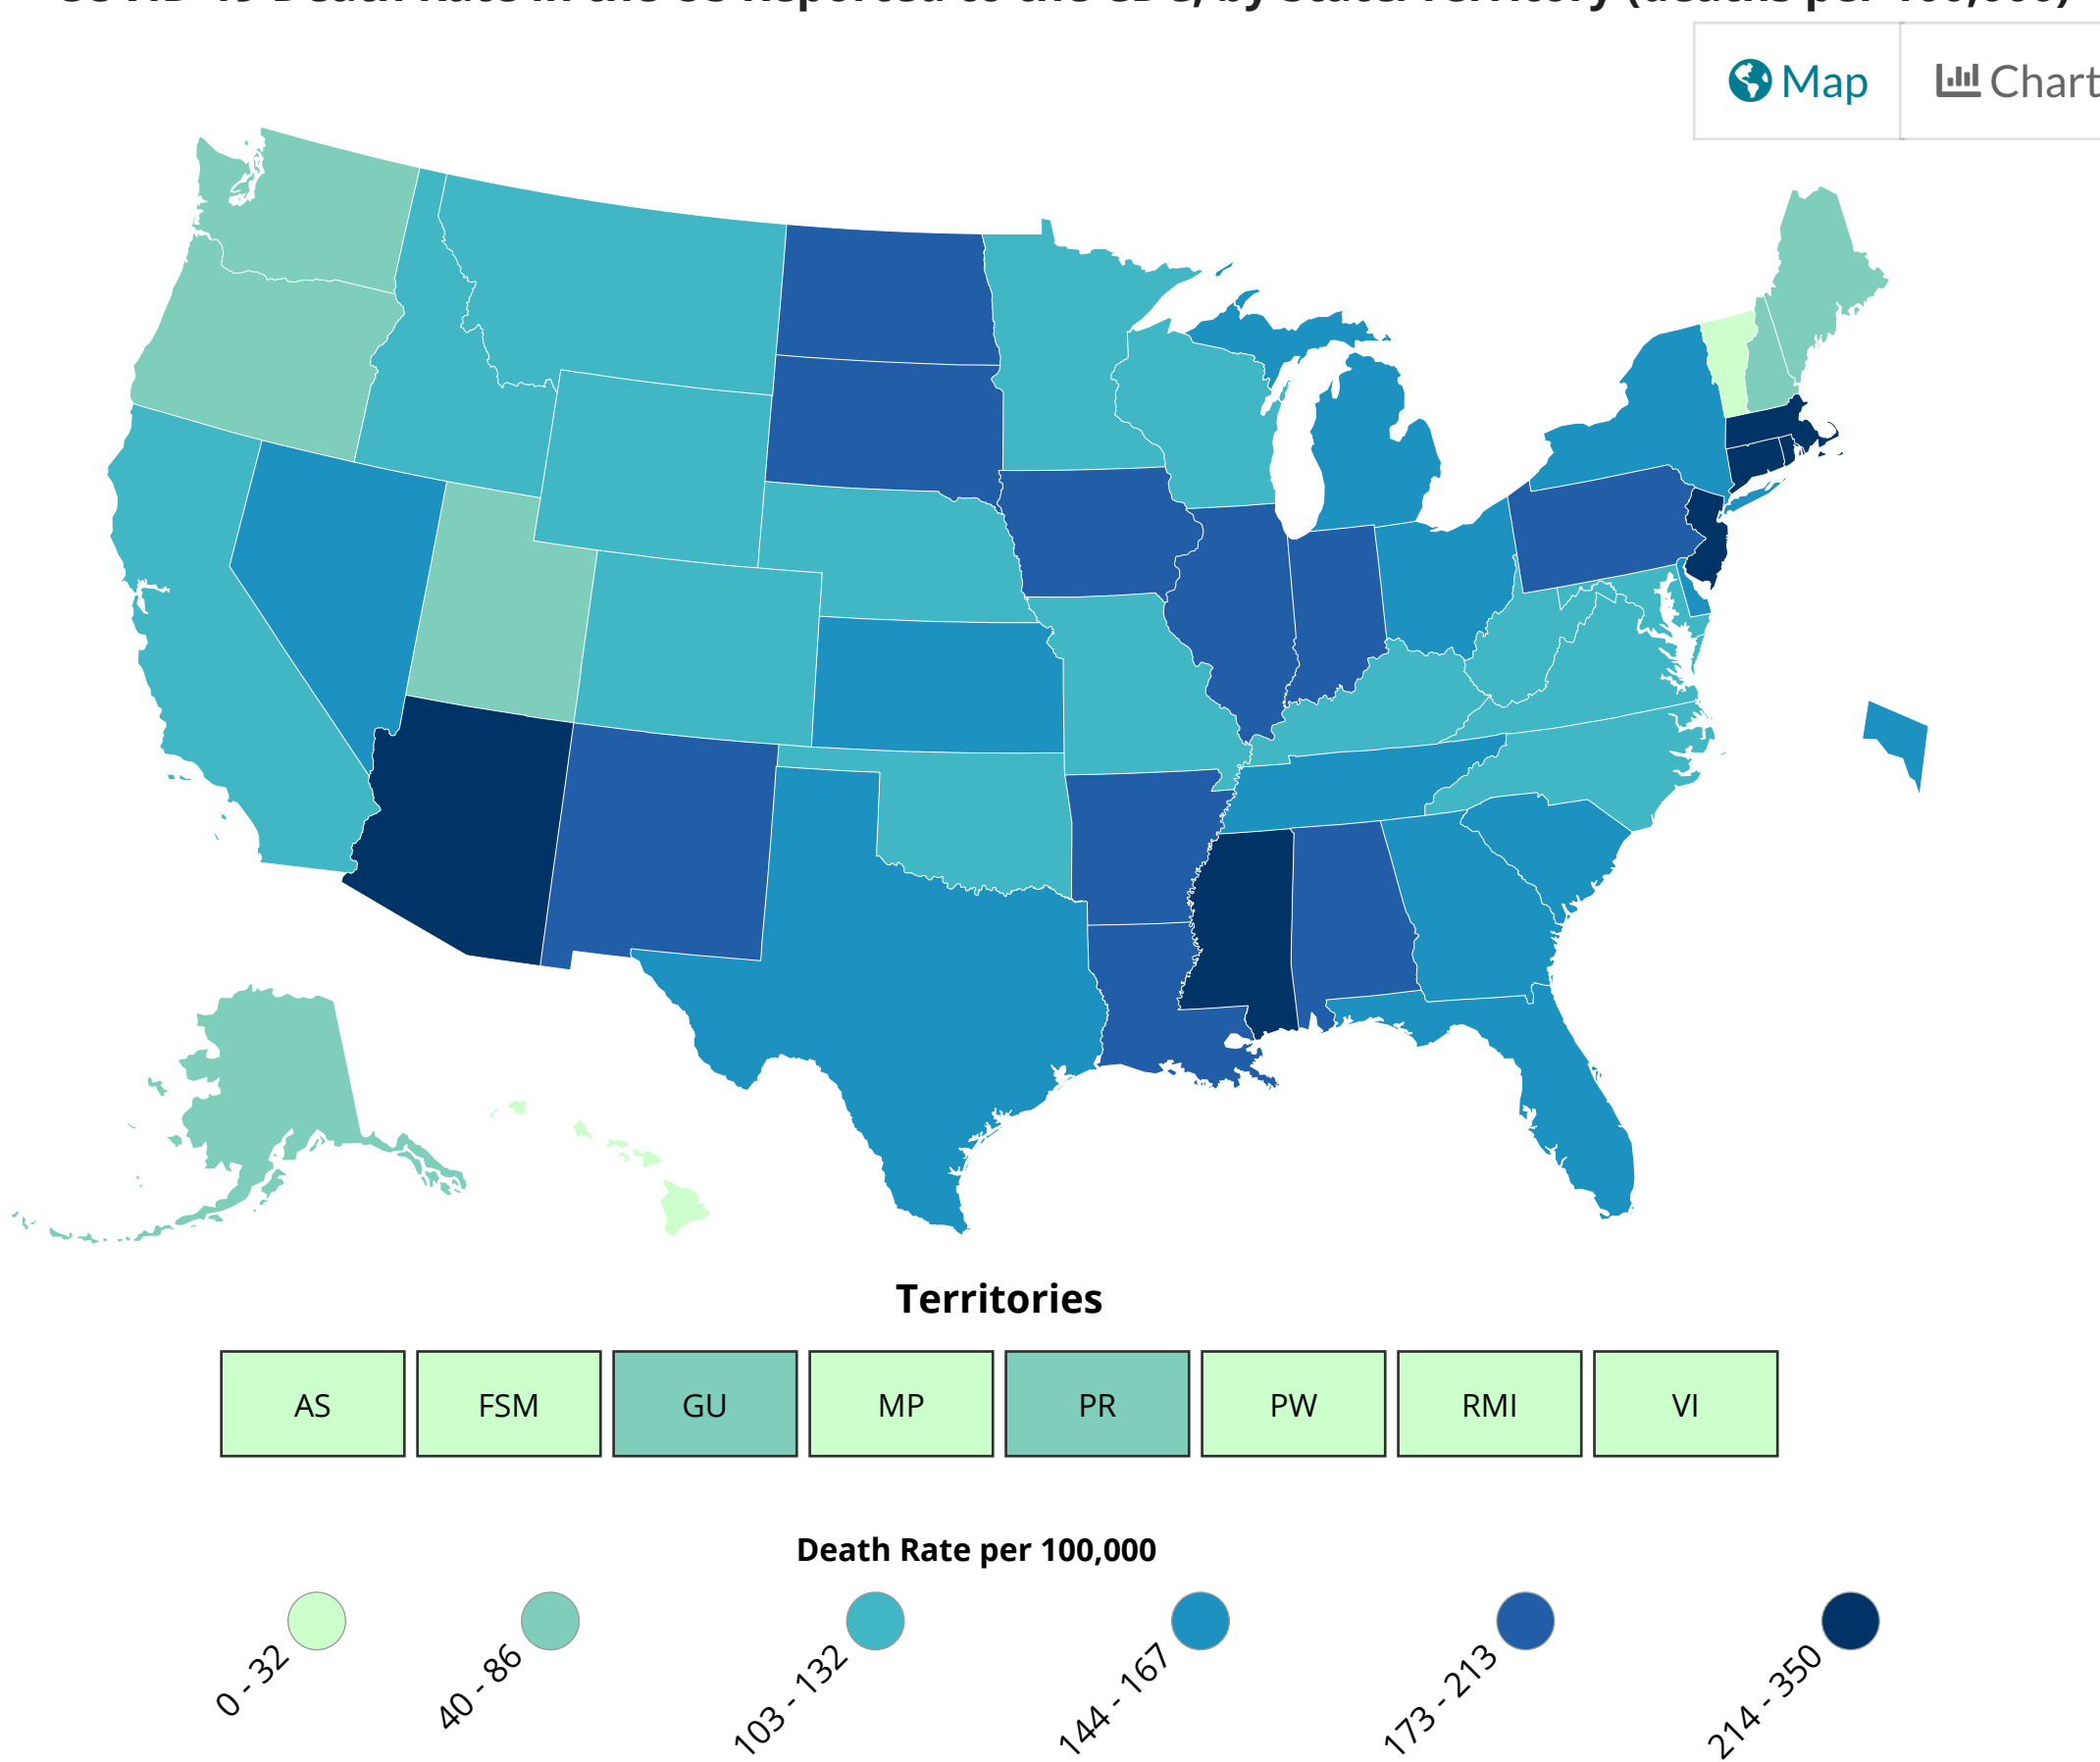

Maps, charts, and data provided by the CDC, updated daily by 8 pm ET†

**View:**  Cases  Deaths  
**Time period:**  Last 7 Days  Since Jan 21, 2020  
**Metric:**  Count  Rate per 100,000

This shows the number of deaths since the pandemic started for every 100,000 people, allowing you to compare areas with different population sizes.

### COVID-19 Death Rate in the US Reported to the CDC, by State/Territory (deaths per 100,000)

### Data Table for Death Rate by State/Territory

CDC | Updated: Mar 2 2021 12:26PM

State/Territory ↕	Death Rate per 100,000 ↕
New York City*	350
New Jersey	262
Rhode Island	237
Massachusetts	232
Mississippi	225
Arizona	219
Connecticut	214
South Dakota	213
Louisiana	207
Alabama	202
North Dakota	189
Indiana	187
Pennsylvania	187
Illinois	179
New Mexico	177
Arkansas	173
Iowa	173
Tennessee	167
South Carolina	166
Michigan	165
Georgia	163
New York*	163
Kansas	162
Nevada	160
Ohio	148
Texas	148
Delaware	146
District of Columbia	144
Florida	144
California	132
Maryland	130
Missouri	129
West Virginia	128
Montana	126
Wisconsin	120
Minnesota	116
Wyoming	115
Oklahoma	114
North Carolina	107
Nebraska	107
Idaho	104
Kentucky	104
Virginia	104
Colorado	103
New Hampshire	86
Guam	79
Washington	65
Puerto Rico	63
Utah	60
Maine	52
Oregon	52
Alaska	40

†Data will update as soon as they are reviewed and verified, oftentimes before 8 pm ET. However, daily updates might be delayed due to delays in reported data.

On 4 February 2021, a state reported 1,507 new deaths. CDC is working with the state to assess the time period from which these data cover. This may temporarily impact death counts, rates and averages.

**Data Sources, References & Notes:** The case classifications for COVID-19, a nationally notifiable disease, are described in an [an updated interim COVID-19 position statement and case definition](#) issued by the Council of State and Territorial Epidemiologists on August 5, 2020 . However, there is some variation in how jurisdictions implement these case classifications. More information on how CDC collects COVID-19 case surveillance data can be found at [CDC's COVID-19 FAQ webpage](#).

Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial jurisdictions to the Centers for Disease Control and Prevention (CDC) since January 21, 2020, with the exception of persons repatriated to the United States from Wuhan, China, and Japan. All displayed counts include confirmed COVID-19 cases and deaths as reported by U.S. states, U.S. territories, New York City (NYC), and the District of Columbia from the previous day. Counts for certain jurisdictions also include probable COVID-19 cases and deaths. Counts for NYC and New York State are shown separately; data for New York State show total cases and deaths for the state excluding data for NYC. COVID-19 case and death data that are not available to CDC are denoted by N/A. For aggregate state level data, CDC calculates the number of new cases or deaths each day by calculating the difference in cumulative counts reported by the state from the day before. Historical data are not typically updated unless requested by the state. Therefore, the number of historical cases and deaths presented on CDC's website reflect the date the data was reported to CDC and not necessarily the date the case or death was recorded in the state.

The map can be modified to show cases and deaths per 100,000 people in the last 7 days, total new cases and deaths in the last 7 days, total cases and deaths since January 21, 2020, and rates for cases (cases/100,000 people) and deaths (deaths/100,000). The average daily rate per 100,000 people in the last 7 days is calculated as the 7-day moving average of new cases or deaths (current day + 6 preceding days divided by 7) per 100,000 people using the US Census Bureau Population Estimates Program (<https://www.census.gov/data/datasets/time-series/demo/popest/2010s-counties-total.html>). The 7-day cumulative rate is calculated as (current day + 6 preceding days) per 100,000 people using the US Census Bureau Population Estimates Program (<https://www.census.gov/data/datasets/time-series/demo/popest/2010s-counties-total.html>). Rates per 100,000 are calculated as the total cases or deaths per 100,000 people using the US Census Bureau Population Estimates Program (<https://www.census.gov/data/datasets/time-series/demo/popest/2010s-counties-total.html>).

\*2018 population estimates are still used for American Samoa, Federated States of Micronesia, Guam, New York City, Northern Mariana Islands, Palau, Republic of Marshall Islands and United States Virgin Islands.

CDC's overall COVID-19 case and death numbers are validated through a confirmation process with each jurisdiction. COVID-19 case and death numbers reported on other websites may differ from what is posted on the CDC COVID Data Tracker due to the timing of reporting and COVID Data Tracker updates, which may differ by up to 24 hours. CDC COVID-19 counts from previous dates may be continually revised as more records are received and processed. Not all jurisdictions report counts daily; some counts are reported in batches and may increase COVID-19 case and death counts at different intervals and appear as spikes. The process used for finding and confirming COVID-19 cases and deaths displayed by other sites may differ.

On 18 December, Texas reported 171,505 historical counts of probable cases with dates between 1 November and 18 December. This raised the total number of new cases in both Texas and the U.S. during this time period and correspondingly affects the 7-day rolling average of new cases.
