View and Download COVID-19 Case Surveillance Public Use Data

On 4 February 2021, a state reported 1,507 new deaths. CDC is working with the state to assess the time period from which these data cover. This may temporarily impact death counts, rates and averages.

August 5, 2020. However, there is some variation in how jurisdictions implement these case classifications. More information on how CDC collects COVID-19 case surveillance data can be found at CDC's COVID-19 FAQ webpage. Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial jurisdictions to the Centers for Disease

**Data Sources, References & Notes:** The case classifications for COVID-19, a nationally notifiable disease, are described in an <u>an</u>

updated interim COVID-19 position statement and case definition issued by the Council of State and Territorial Epidemiologists on

CDC's new COVID Data Tracker Weekly Review helps you stay up-to-date on the pandemic with weekly visualizations, analysis, and

Control and Prevention (CDC) since January 21, 2020, with the exception of persons repatriated to the United States from Wuhan, China, and Japan. All displayed counts include confirmed COVID-19 cases and deaths as reported by U.S. states, U.S. territories, New York City (NYC), and the District of Columbia from the previous day. Counts for certain jurisdictions also include probable COVID-19 cases and deaths. Counts for NYC and New York State are shown separately; data for New York State show total cases and deaths for the state excluding data for NYC. COVID-19 case and death data that are not available to CDC are denoted by N/A. For aggregate state level data, CDC calculates the number of new cases or deaths each day by calculating the difference in cumulative counts reported by the state from the day before. Historical data are not typically updated unless requested by the state. Therefore, the number of historical cases and deaths presented on CDC's website reflect the date the data was reported to CDC and not necessarily the date the

case or death was recorded in the state. The map can be modified to show cases and deaths per 100,000 people in the last 7 days, total new cases and deaths in the last 7 days, total cases and deaths since January 21, 2020, and rates for cases (cases/100,000 people) and deaths (deaths/100,000). The 7-day cumulative rate is calculated as (current day + 6 preceding days) per 100,000 people using the <u>US Census Bureau Population Estimates</u> Program. Rates per 100,000 are calculated as the total cases or deaths per 100,000 people using the US Census Bureau Population

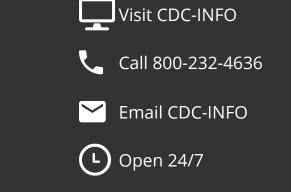

Estimates Program. \*2018 population estimates are still used for American Samoa, Federated States of Micronesia, Guam, New York City, Northern

and death numbers reported on other websites may differ from what is posted on the CDC COVID Data Tracker due to the timing of reporting and COVID Data Tracker updates, which may differ by up to 24 hours. CDC COVID-19 counts from previous dates may be continually revised as more records are received and processed. Not all jurisdictions report counts daily; some counts are reported in batches and may increase COVID-19 case and death counts at different intervals and appear as spikes. The process used for finding and confirming COVID-19 cases and deaths displayed by other sites may differ.

CDC's overall COVID-19 case and death numbers are validated through a confirmation process with each jurisdiction. COVID-19 case

Provision of historical cases and deaths by jurisdictions can impact new case and death numbers and 7-day averages. On 18 December, Texas reported 171,505 historical counts of probable cases with dates between 1 November and 18 December. Additionally, historical cases were reported on: Feb 27, 2021 (TX - 2,990); Mar 1, 2021 (TX - 1,840); Mar 3, 2021 (TX - 1,641, AL - 2,114); and Mar 8, 2021 (MO - 81,806, TX - 1,295). Historical deaths were reported on: 2020 (NJ - 1,824); Feb 4, 2021 (IN - 1,507): Feb 12, 2021 (OH - 2,559); Feb 13, 2021 (OH - 1,204); and Feb 25, 2021 (CA - 806). On 08 March 2021, Texas reported 1,295 and Missouri reported 81,806 historical counts of probable cases. On 19 March 2021, the historical probable cases for Missouri were reassigned to the appropriate date as indicated on the state's website. For Texas, the historical data raised the total number of new cases in Texas and the U.S. on this day and correspondingly affects the 7-day rolling average of new cases. Without the inclusion of the historical probable

cases in COVID Data Tracker for 08 March 2021, the resultant new cases in the United States on 08 March 2021 would be 41,237.
