## **CDC COVID-19 Vaccine Effectiveness Studies**

#### Katherine Fleming-Dutra, MD Vaccine Effectiveness Team COVID-19 Response

May 12, 2021

#### cdc.gov/coronavirus

## Need for post-authorization vaccine effectiveness (VE) estimates

- Real-world effectiveness may differ from efficacy under trial conditions due to implementation differences in:
  - Adherence to cold chain requirements
  - Broader population eligible to receive the vaccine
  - For 2-dose regimens, timing and coverage of second dose
- Build on evidence from clinical trials, specifically for:
  - Groups experiencing disproportionate impact of COVID-19
  - Severe disease
  - SARS-CoV-2 infection and transmission
  - Duration of protection

## CDC COVID-19 VE policy priorities: results of internal and external input

Timeline after introduction	Priority
Immediate	<ul> <li>Does vaccine protect against symptomatic disease as expected?</li> </ul>
Subsequent	<ul> <li>VE against key outcomes</li> <li>Severe disease</li> <li>Non-severe disease</li> <li>Infection and transmission</li> <li>VE in groups experiencing disproportionate impact of COVID-19</li> <li>Adults aged ≥65 years, including those in long-term care facilities (LTCFs)</li> <li>People with key underlying conditions (e.g., immunocompromising conditions, obesity, diabetes)</li> <li>Racial and ethnic minority groups experiencing disproportionate impact</li> <li>VE for regimen-related questions for 2 dose products</li> <li>Single-dose and prolonged intervals; mixed-dose schedules (&gt;1 product)</li> <li>Viral evolution: Do genome changes impact VE?</li> </ul>
Later stage	<ul> <li>Duration of protection</li> <li>Comparison of VE across products</li> </ul>

# COVID-19 mRNA vaccine effectiveness literature globally

. .

### **COVID-19 mRNA VE literature caveats**

- The literature is rapidly evolving and growing exponentially.
- Wide variety of methods, populations, definitions are used.
- Most literature is currently in pre-print form, with few peer-reviewed publications.
- Quality varies widely.
- Meta-analyses and formal comparisons are not appropriate at this time due to these caveats.

## Additional ongoing CDC VE assessments

· ·

## **Current VE assessments**

VE	priority	Prospective data collection	Electronic health record (EHR) and claims analyses (coordination across US gov)		
Imr	nediate priority				
	Does vaccine work as expected to prevent symptomatic disease?	Test-negative design case-control among healthcare personnel			
Sub	sequent priorities				
	Older adults, including residents of long-term care facilities (LTCFs)	Case-control among adults ≥65 years (COVID-NET linked to CMS); National Healthcare Safety Network (NHSN)	CMS cohort (FDA, CMS) EHR data sets (CDC, VA, FDA)		
	Infection and transmission	Prospective longitudinal cohorts, including among healthcare personnel and frontline workers; case-ascertained household cohorts for transmission			
	Severe disease/hospitalization	Test-negative design (for adults and children); conventional case-control using hospitalized controls; screening method	EHR data sets (CDC, VA, FDA); retrospective cohort or test-negative design		
	Non-severe disease	Test-negative design among outpatients	Potentially using EHR data sets		
	Those with key underlying conditions (e.g., immunocompromised)	Captured in above studies	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA)		
	Racial and ethnic groups disproportionately affected by COVID-19	Captured in above studies; test-negative design in American Indian and Alaska Native populations	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA); exploring IHS EHR (IHS)		
Ĩ	Vaccine impact	Ecologic analyses of disease incidence/seroprevalence and vaccination coverage; comparisons of expection vaccine impact from models with observed impact			

#### Current VE assessments including children Electronic health record (EHR) and claims

VE priority		Prospective data collection	analyses (coordination across US gov)
Immedia	te priority		
Does prev	vaccine work as expected to ent symptomatic disease?	Test-negative design case-control among healthcare personnel	
Subseque	ent priorities		
Olde of lo	r adults, including residents ng-term care facilities (LTCFs)	Case-control among adults ≥65 years (COVID-NET linked to CMS); National Healthcare Safety Network (NHSN)	CMS cohort (FDA, CMS) EHR data sets (CDC, VA, FDA)
Infec	tion and transmission	Prospective longitudinal cohorts, including among healthcare personnel and frontline workers; case-ascertained household cohorts for transmission	
Seve	re disease/hospitalization	Test-negative design (for adults and children); conventional case-control using hospitalized controls; screening method	<b>EHR data sets</b> (CDC, VA, FDA); retrospective cohort or test-negative design
Non-	severe disease	Test-negative design among outpatients	Potentially using EHR data sets
Thos cond imm	e with key underlying itions (e.g., unocompromised)	Captured in above studies	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA)
Racia dispr COVI	al and ethnic groups oportionately affected by D-19	Captured in above studies; <b>test-negative design in American</b> Indian and Alaska Native populations	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA); exploring IHS EHR (IHS)
Vacc	ine impact	Ecologic analyses of disease incidence/seroprevalence and vacci vaccine impact from models with observed impact	nation coverage; comparisons of expected

## OVERCOMING2: VE against COVID-19 or Multisystem Inflammatory Syndrome in Children (MIS-C) among hospitalized children <19 years

- Based on an intensive care unit (ICU) network assessing influenza VE against critical illness in pediatric patients (aged <19 years)</li>
- During 2020: Overcoming enrolled all MIS-C patients and ICU patients with COVID-19 at ~57 US pediatric hospitals
- Primary objectives:
  - VE against any hospitalized COVID-19 and MIS-C
    - Two control groups (test-negative acute respiratory illness and non-acute respiratory illness hospitalizations)
  - VE by subgroup: variant, vaccine type, age, race/ethnicity, sex, time since vaccination, partial vaccination

## **Do viral genome changes impact VE?**

- Selected prospective platforms will collect specimens from cases, where possible, for whole genome sequencing.
  - Will not be performed in real time
  - May not be powered for variant-specific VE assessments
- Vaccine evaluation unit is assessing vaccine breakthrough cases with hospitalization or death.
  - A collaboration with the Emerging Infections Program comparing the frequency of variants among vaccinated and unvaccinated persons may shed light.
- Work is part of broader CDC efforts to monitor the impact of SARS-CoV-2 variants.

#### Current VE assessments including genomic characterization Electronic health record (EHR) and claims

VE priority		Prospective data collection	analyses (coordination across US gov)	
Imn	nediate priority			
	Does vaccine work as expected to prevent symptomatic disease?	Test-negative design case-control among healthcare personnel		
Sub	sequent priorities			
	Older adults, including residents of long-term care facilities (LTCFs)	Case-control among adults ≥65 years (COVID-NET linked to CMS); National Healthcare Safety Network (NHSN)	CMS cohort (FDA, CMS) EHR data sets (CDC, VA, FDA)	
	Infection and transmission	Prospective longitudinal cohorts, including among healthcare personnel and frontline workers; case-ascertained household cohorts for transmission		
	Severe disease/hospitalization	Test-negative design (for adults and children); conventional case-control using hospitalized controls; screening method	EHR data sets (CDC, VA, FDA); retrospective cohort or test-negative design	
	Non-severe disease	Test-negative design among outpatients	Potentially using EHR data sets	
	Those with key underlying conditions (e.g., immunocompromised)	Captured in above studies	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA)	
	Racial and ethnic groups disproportionately affected by COVID-19	Captured in above studies; <b>test-negative design in American</b> Indian and Alaska Native populations	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA); exploring IHS EHR (IHS)	
	Vaccine impact	Ecologic analyses of disease incidence/seroprevalence and vacci vaccine impact from models with observed impact	nation coverage; comparisons of expected	

## **Duration of protection from COVID-19 vaccines**

- An important VE priority is to understand the duration of protection provided by COVID-19 vaccines.
  - This will inform the question about the need for a booster.
  - It is important to take into account changes in the circulating variants over time.

#### Current VE assessments including duration of protection Electronic health record (EHR) and claims

VE priority Prospective data collection		analyses (coordination across US gov)		
Im	mediate priority			
	Does vaccine work as expected to prevent symptomatic disease?	Test-negative design case-control among healthcare personnel		
Sub	osequent priorities			
	Older adults, including residents of long-term care facilities (LTCFs)	Case-control among adults ≥65 years (COVID-NET linked to CMS); National Healthcare Safety Network (NHSN)	CMS cohort (FDA, CMS) EHR data sets (CDC, VA, FDA)	
	Infection and transmission	Prospective longitudinal cohorts, including among healthcare personnel and frontline workers; case-ascertained household cohorts for transmission		
	Severe disease/hospitalization	Test-negative design (for adults and children); conventional case-control using hospitalized controls; screening method	EHR data sets (CDC, VA, FDA); retrospective cohort or test-negative design	
	Non-severe disease	Test-negative design among outpatients	Potentially using EHR data sets	
	Those with key underlying conditions (e.g., immunocompromised)	Captured in above studies	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA)	
	Racial and ethnic groups disproportionately affected by COVID-19	Captured in above studies; <b>test-negative design in American</b> Indian and Alaska Native populations	CMS (FDA, CMS); EHR data sets (CDC, VA, FDA); exploring IHS EHR (IHS)	
	Vaccine impact	Ecologic analyses of disease incidence/seroprevalence and vaccination coverage; comparisons of expected vaccine impact from models with observed impact		

## **CDC VE assessments in outbreak settings**

- Residents of long-term care facilities
- Incarcerated and detained persons and staff in corrections facilities
- Actively looking for COVID-19 outbreaks in congregate settings to assess:
  - Variant-specific VE
  - VE for Johnson & Johnson's Janssen vaccine
  - VE among adolescents and children once eligible for vaccine

### Conclusion

- Initial COVID-19 VE estimates from recently published reports are demonstrating remarkably consistent results across studies with a variety of methods and populations.
- There is an urgent need for VE data to guide vaccine policy.
- A broad approach, including a diversity of projects, methods, bias control, populations, and sample sizes strengthens our understanding of the true real-world performance of these vaccines.
