COVID Data Tracker

Demographic Trends of COVID-19 cases and deaths in the US reported to CDC

Maps, charts, and data provided by CDC, updates Tues-Sun by 8 pm ET^{\dagger}

CDC is working with states to provide more information on race/ethnicity for reported cases. The percent of reported cases that include race/ethnicity data is increasing.

These data only represent the geographic areas that contributed data on race/ethnicity. Every geographic area has a different racial and ethnic composition. These data are not generalizable to the entire U.S. population.

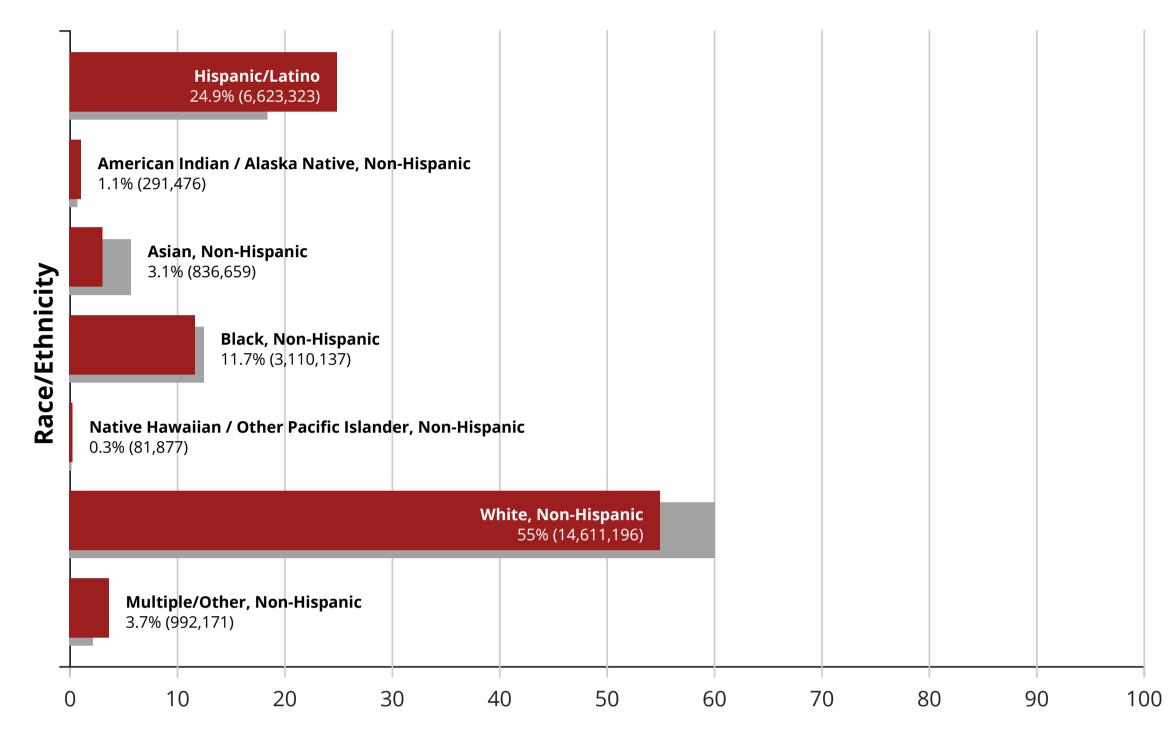

If cases were distributed equally across racial and ethnic populations, one would expect to see more cases in those populations that are more highly represented in geographic areas that contributed data.

Percentages displayed in the charts below represent the percent of cases or deaths for which the demographic variable of interest is known.

CDC | Data as of: Wednesday, December 1, 2021 2:39 PM ET. Posted: Wednesday, December 1, 2021 4:00 PM ET

Deaths by Age Group:

Data from 657,915 deaths. Age group was available for 657,818 (99%) deaths.

in a new count of 144. Counts from surveillance data are provisional and subject to change. On July 22, 2021, COVID Data Tracker released an update to display cases by age group using new age groupings. There was an error in the calculation used to aggregate cases into these new age groups, which resulted in COVID Data Tracker displaying an incorrect percentage of cases among people ages 16-17 years old. This issue has been resolved and the proper percentage of cases among people 16-17 years old is now displayed. On August 12, 2021, data on deaths were adjusted after the identification of a data discrepancy. This resulted in updated counts across several age groups.
