

SUPPLEMENTARY FIGURE 1. Interval<sup>\*,†</sup> between index patient onset date and household contact onset date, restricted to households with only the index patient and one household contact — Four U.S. Jurisdictions, November 2021–February 2022

\* The interval was estimated by calculating the number of days between the symptom onset or positive test result date for the index patient and that of the household contact. For both index patients and household contacts, the case date was either the date of SARS-CoV-2 positive test or date of symptom onset, whichever occurred first.

† Transmission can occur within a household setting on the first day an index patient is infected or on any subsequent day during which they are still shedding viable virus.
