## Niveles de COVID-19 en las comunidades

Para medir el impacto del COVID-19 para la salud y los sistemas de servicios de salud

Actualizado el 10 de mar. del 2022

### Visión general

Hay más herramientas que nunca disponibles para evitar que el COVID-19 sobrecargue a las comunidades y sus sistemas de salud.

Con los niveles actuales altos de vacunación y los altos niveles de inmunidad en la población, tanto por las vacunas como por las infecciones, el riesgo de enfermarse y necesitar un médico, de hospitalización y de muerte a causa del COVID-19 se ha reducido notablemente para la mayoría de las personas. Al mismo tiempo, sabemos que [algunas personas y comunidades](#), como nuestros ciudadanos mayores, las personas con inmunodepresión y las personas con discapacidades, corren mayor riesgo de enfermarse gravemente y enfrentan decisiones difíciles en relación con el COVID-19.

Además de proteger a quienes corren mayor riesgo de resultados graves, concentrarse en reducir las enfermedades que requieren servicios de salud y minimizar la carga para el sistema de salud refleja lo que conocemos en la actualidad acerca de la infección por SARS-CoV-2, la inmunidad que genera la vacunación y haber tenido la infección y las herramientas que tenemos disponibles. Las vacunas son una herramienta de gran protección contra la enfermedad grave, y seguir ampliando la cobertura de vacunación y garantizar que las personas tengan [sus vacunas al día](#) es fundamental para proteger a las personas de hospitalizaciones y muertes.

Los funcionarios de salud y las personas deberían considerar la información actual acerca de las hospitalizaciones por COVID-19 en la comunidad, así como la posibilidad de sobrecarga del sistema de salud local y los casos de COVID-19 en la comunidad al tomar decisiones acerca de las estrategias de prevención comunitarias y las conductas individuales. Las comunidades y las personas además deben tomar decisiones que contemplen si corren mayor riesgo de enfermarse gravemente y tener en cuenta las desigualdades en el acceso a las medidas de prevención.

Conocer los niveles de COVID-19 en la comunidad puede ayudar a las comunidades y a las personas a tomar decisiones con base en su contexto local y sus necesidades particulares. La cobertura de vacunación en la comunidad, así como otra información local, como alertas anticipadas de vigilancia, por ejemplo en aguas residuales, o la cantidad de consultas por COVID-19 en los departamentos de emergencias, cuando está disponible, también puede contribuir a la toma de decisiones de los funcionarios de salud y cada persona.

**Para establecimientos de atención médica:** los niveles de COVID-19 en la comunidad **no** alcanzan a los entornos de atención médica como hospitales u hogares de ancianos. En el caso de los entornos de atención médica, deben seguir usando las [tasas de transmisión en la comunidad](#) y seguir las [recomendaciones para el control y la prevención de infecciones](#) de los CDC para trabajadores de atención médica.

# Cómo miden los CDC los niveles de COVID-19 en las comunidades

Los CDC analizan la combinación de tres parámetros de medición: ingresos nuevos por COVID-19 por cada 100 000 habitantes en los últimos 7 días, el porcentaje de ocupación de camas para hospitalización por pacientes con COVID-19 y la cantidad total de casos nuevos de COVID-19 por cada 100 000 habitantes en los últimos 7 días, para determinar el nivel de COVID-19 en una comunidad. Los ingresos nuevos por COVID-19 y el porcentaje de ocupación de camas para hospitalización representan el potencial actual de sobrecarga del sistema de salud. Los datos de casos nuevos son el indicador de advertencia anticipada de posibles aumentos en la carga para el sistema de salud en caso de un pico de COVID-19.

Con estos datos se clasifica el nivel de COVID-19 en una comunidad como bajo, medio o alto.

| Niveles de COVID-19 en la comunidad - Use el nivel más alto que alcance a su comunidad |                                                                                                       |       |           |       |
|----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|-------|-----------|-------|
| Casos nuevos de COVID-19<br><br>por cada 100 000 personas en los últimos 7 días        | Indicadores                                                                                           | Bajo  | Medio     | Alto  |
| Menos de 200                                                                           | Ingresos nuevos por COVID-19 por cada 100 000 habitantes (total de 7 días)                            | <10   | 10-19.9   | ≥20   |
|                                                                                        | Porcentaje de ocupación de camas para hospitalización por pacientes con COVID-19 (promedio de 7 días) | <10 % | 10-14,9 % | ≥15 % |
| 200 o más                                                                              | Ingresos nuevos por COVID-19 por cada 100 000 habitantes (total de 7 días)                            | NA    | <10       | ≥10   |
|                                                                                        | Porcentaje de ocupación de camas para hospitalización por pacientes con COVID-19 (promedio de 7 días) | NA    | <10 %     | ≥10 % |

El nivel de COVID-19 en una comunidad se determina con la cifra más alta de ingresos nuevos y ocupación de camas para hospitalización, con base en el nivel actual de casos nuevos por cada 100 000 habitantes en los últimos 7 días.

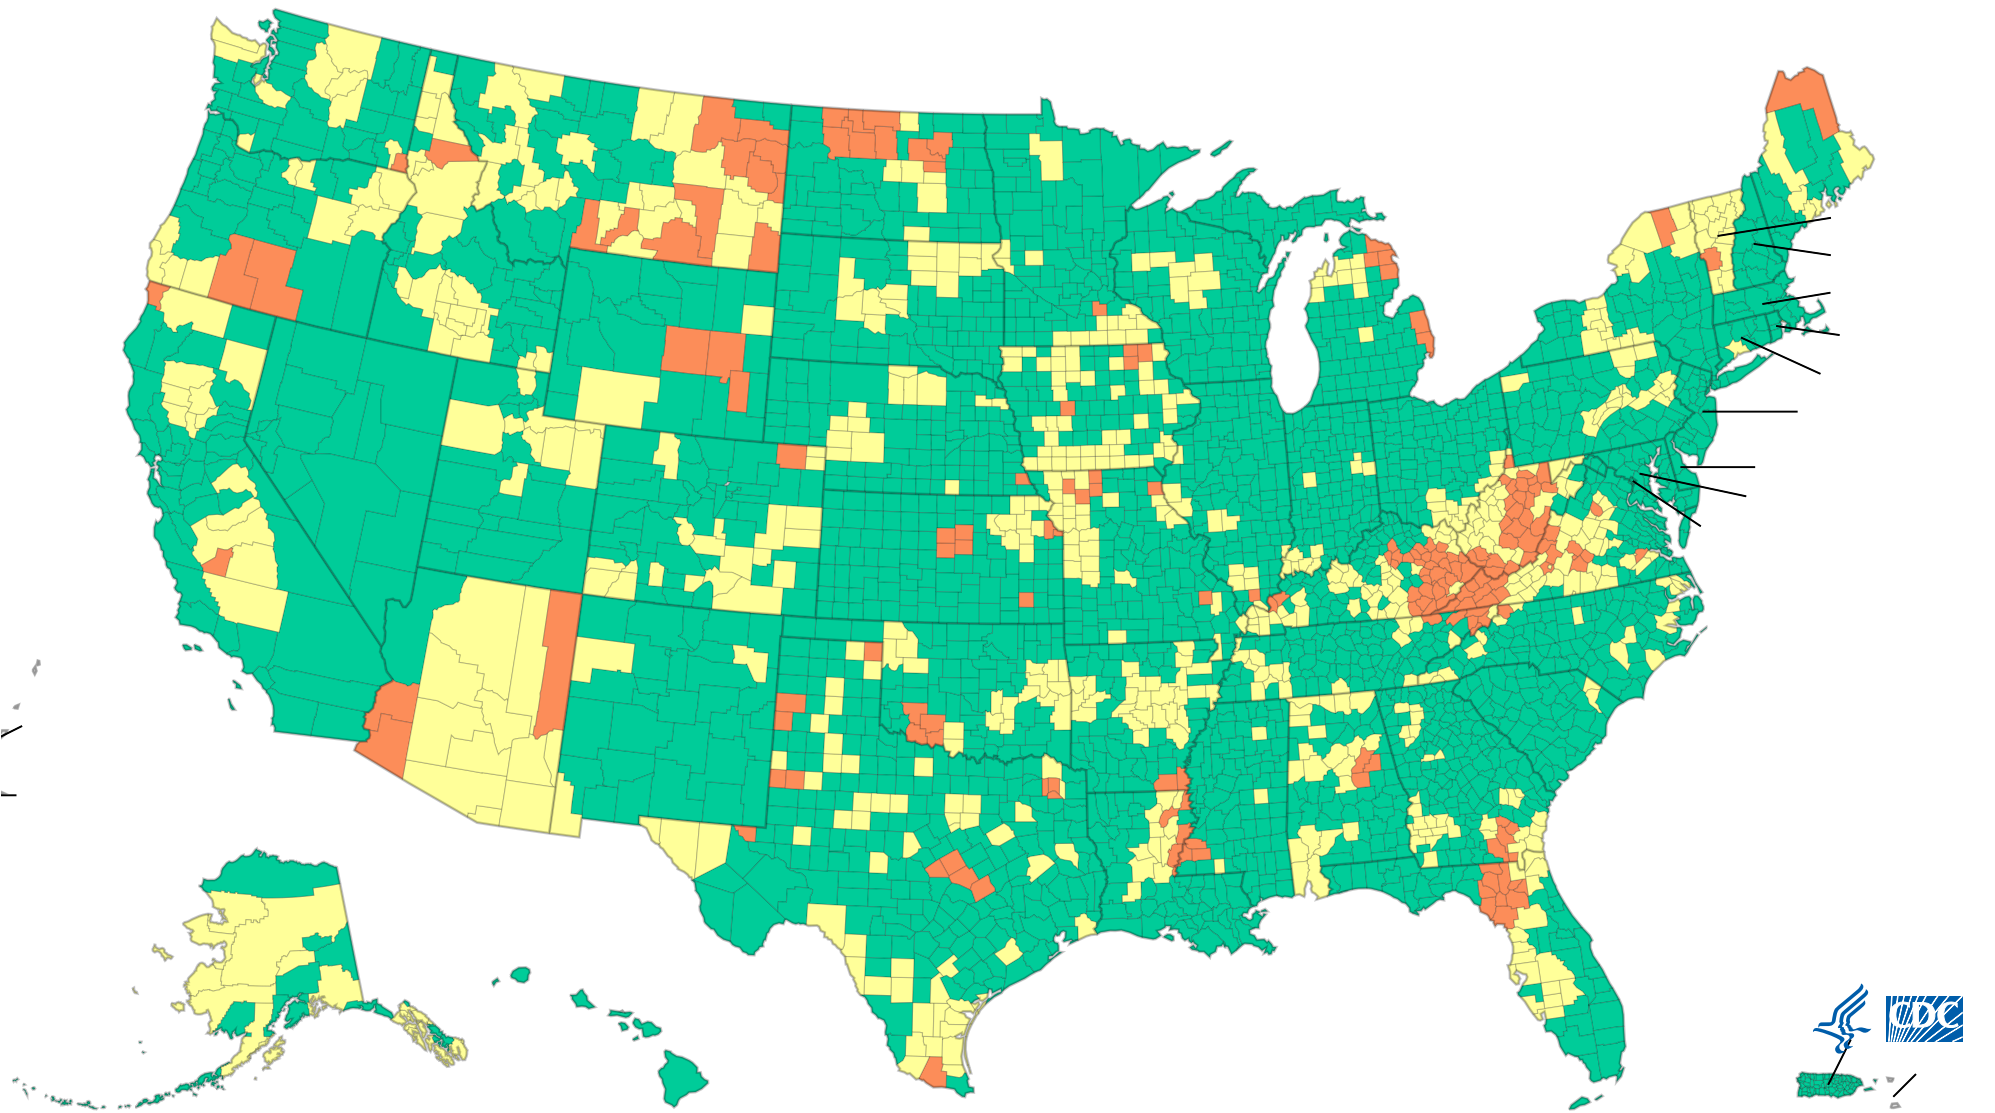

Para calcular el nivel de COVID-19 en la comunidad:

- Primero determine si hay un condado, estado o territorio con menos de 200 casos nuevos por cada 100 000 personas en los últimos 7 días o 200 casos nuevos o más por cada 100 000 personas en los últimos 7 días.

- Luego determine el nivel (bajo, medio o alto) de los indicadores de ingresos nuevos y ocupación de camas para hospitalización usando la escala de la cantidad de casos nuevos del área.
- El nivel de COVID-19 en la comunidad se basa en las mediciones más altas de ingresos nuevos y ocupación de camas para hospitalización.
- Consulte los datos de su condado de [niveles de COVID-19 en la comunidad](#).

Descargar datos (CSV)

Los niveles de COVID-19 en la comunidad se calcularon el 10 de marzo del 2022

- New COVID-19 cases per 100 000 population (7-day total) are calculated using data from March 3-March 9, 2022
- New COVID-19 admissions per 100 000 population (7-day total) are calculated using data from March 2-March 8, 2022
- Percent of inpatient beds occupied by COVID-19 patients (7-day average) is calculated using data from March 2-March 8, 2022
- To view and download this week and previous weeks data visit [United States COVID-19 Community Levels by County as Originally Posted | Data | Centers for Disease Control and Prevention \(cdc.gov\)](#)

Los datos de Samoa Americana, Guam, el Estado Libre Asociado de las Islas Marianas del Norte y las Islas Vírgenes de los Estados Unidos están disponibles en el archivo CSV descargable.

Tabla de datos

- \* Hosp. cada 100 mil = nuevas hospitalizaciones por COVID-19 cada 100 000 habitantes (total de 7 días)
- \*\* Camas de hosp. ocup. = porcentaje de camas para pacientes hospitalizados con personal ocupadas por pacientes con COVID-19 (promedio de 7 días)
- \*\*\* Número de HSA = número del área de servicio de salud
- \*\*\*\* Nombre de HSA = nombre del área de servicio de salud

# Nivel de COVID-19 en la comunidad y prevención del COVID-19

Quienes tienen [sus vacunas al día](#) tienen un riesgo mucho más bajo de enfermarse gravemente y morir a causa del COVID-19 en relación con las personas que no están vacunadas. Al tomar decisiones sobre las estrategias de prevención en la comunidad y los comportamientos preventivos individuales además de la vacunación, los funcionarios de salud y las personas deben considerar el nivel de COVID-19 en la comunidad de su condado. Las estrategias de prevención estratificadas, como mantener el esquema de vacunación al día, hacerse pruebas de evaluación, la ventilación y el uso de mascarillas, pueden ayudar a limitar las formas graves de la enfermedad y reducir la posibilidad de sobrecargar el sistema de salud. Los CDC recomiendan usar la información de niveles de COVID-19 en la comunidad por condado para decidir qué medidas de prevención del COVID-19 implementar entre las personas y comunidades.

Algunos entornos comunitarios como las escuelas y algunos entornos colectivos de alto riesgo, como establecimientos correccionales y refugios para personas sin hogar, pueden incorporar otras capas de prevención (como distanciamiento físico, rastreo de contactos) con base en la información y los datos acerca de las características del entorno. Los espacios colectivos de alto riesgo pueden añadir estrategias de prevención según sea necesario en caso de un brote dentro del establecimiento, incluso si los niveles de COVID-19 en la comunidad que los rodea son bajos. Las jurisdicciones deben monitorear la equidad en el acceso a las vacunas y otras iniciativas de prevención y evaluar los datos de hospitalizaciones cuando sea posible para garantizar las medidas de extensión comunitaria necesarias para abordar desigualdades en el acceso a servicios de salud de alta calidad. Es posible que las recomendaciones basadas en los niveles de COVID-19 en la comunidad no alcancen a [entornos de atención médica](#) como hospitales o establecimientos de cuidados a largo plazo.

Visite la [Herramienta de seguimiento de datos del COVID-19\\*](#) para obtener más información sobre los indicadores y métricas que se utilizan para calcular el nivel de COVID-19 en la comunidad de su [condado](#). Tenga en cuenta que no hay datos a nivel de condados para los territorios. Para ver los datos más precisos y actualizados de cualquier condado o estado, visite el [sitio web del departamento de salud correspondiente](#).

\*La herramienta de seguimiento de datos del COVID-19 puede mostrar datos que difieren de los que aparecen en sitios web locales y estatales. Esto puede deberse a diferencias en la forma en que se obtuvieron los datos, en cómo se calcularon las métricas o en el momento de las actualizaciones de las páginas web.
