COVID Data Tracker

CDC recommends use of COVID-19 Community Levels to determine the impact of COVID-19 on communities and to take action. CDC also provides Transmission Levels (also known as Community Transmission) to describe the amount of COVID-19 spread within each county. Healthcare facilities use Transmission Levels to determine infection control interventions.

confirmation process with each jurisdiction.

of historic and recent probable cases and deaths to confirmed totals.

to data validation and standard maintenance procedures.

Date of death: Florida, North Carolina

• The data represent COVID-19 Nucleic Acid Amplification Test (NAAT) results, which include reverse transcriptasepolymerase chain reaction (RT-PCR) tests from laboratories in the United States, including commercial and reference laboratories, public health laboratories, hospital laboratories, and other testing locations. The data represent laboratory test totals-not individual people-and exclude antibody and antigen tests. The data are provisional and subject to change. National total test counts reflect the latest reported data from states and may not match the sum of the data presented for all jurisdictions. The data may also not include results from all testing sites within a jurisdiction (e.g., point-of-care test sites) and therefore reflect the majority, but not all, COVID-19

NAATs in the United States. Information about how laboratory data are reported to CDC can be found at:

On September 30th, 2021, CDC moved to presenting the NAAT testing data with a 7-day lag for testing volume and

a 3-day lag for percent positivity to better align with other CDC products. This 3-day lag for percent positivity was
