state. Provision of historical cases and deaths by jurisdictions can influence new case and death numbers and 7-day averages once CDC incorporates these data and assigns the data to the appropriate dates. Historical cases and deaths are still reflected in the cumulative national totals. • 2018 population estimates are still used for American Samoa, Federated States of Micronesia, Guam, New York City, Northern Mariana Islands, Palau, Republic of Marshall Islands and United States Virgin Islands. **Jurisdictional Reporting Differences** CDC uses various methods to gather aggregate case and death data from states, territories, and other jurisdictions' health departments. Learn more at About CDC Case and Death COVID-19 Data. The methods and frequency of data reporting varies by jurisdiction. The dates used to document case and death incidences also vary. The dates used by jurisdictions for COVID-19 cases that CDC receives include:

Report date (when the event was reported to the health department or reported by the health department to CDC):

American Samoa, Arkansas, California, Colorado, Connecticut, District of Columbia, Federated States of Micronesia,

Georgia, Guam, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Minnesota, Montana, Nevada, New

Hampshire, New Jersey, New Mexico, New York (excluding NYC), North Dakota, Ohio, Oregon, Palau, Pennsylvania,

• A combination of date of death and report date: Alabama, Alaska, Arizona, Delaware, Kentucky, Massachusetts,

Maryland, Michigan, Mississippi, Missouri, Nebraska, New York City, Northern Mariana Islands, Oklahoma, Texas,

Please note that jurisdictional reporting methods are subject to change. These changes can cause artificial data fluctuations

on COVID Data Tracker. For example, when jurisdictions opt to report death data by date of death instead of report date, it

may appear that overall deaths from COVID-19 are decreasing. This does not reflect a true decline and data should be

September 28, 2021: Nebraska began submitting both confirmed and probable case and death counts for COVID Data

Tracker. Cumulative cases and death counts displayed after 9/27/2021 reflect a large increase because of the addition of

March 30, 2022: The increases observed in Rhode Island's COVID-19 death counts on 2/20/2021 and 3/2/2022 are due to

interpreted with caution. CDC's overall COVID-19 case and death numbers are validated through a confirmation process

Puerto Rico, Republic of Marshall Islands, Rhode Island, South Carolina, South Dakota, Tennessee, U.S. Virgin Islands,

The dates used by jurisdictions for COVID-19 related deaths that CDC receives include:

Utah, Virginia, Washington, West Virginia, Wisconsin, Wyoming

This information is confirmed and up to date as of July 19, 2021.

historic and recent probable cases and deaths to confirmed totals. October 25, 2021: CDC stopped spreading aggregate COVID-19 case and death counts evenly over jurisdictions' nonreporting days (i.e., smoothing), which had been done to reflect case and death trends across those days and to improve the quality of data visualizations. This update was made to avoid under-reporting of weekend averages.

ncov/lab/reporting-lab-data.html

tests / total NAAT tests) x 100].

• On September 30th, 2021, CDC moved to presenting the NAAT testing data with a 7-day lag for testing volume and a 3day lag for percent positivity to better align with other CDC products. This 3-day lag for percent positivity was implemented for all NAAT percent positivity metrics presented on COVID Data Tracker. • Testing Data update for February 22, 2022: IA has incomplete negative test result data, impacting testing volumes and percent positivity. • Testing Data update for April 26, 2021: WA has incomplete negative test result data from Sep 1, 2021 - Jan 31, 2022, impacting testing volumes and percent positivity.

CDC's new COVID Data Tracker Weekly Review helps you stay up-to-date on the pandemic with weekly visualizations,

Information about how laboratory data are reported to CDC can be found at: https://www.cdc.gov/coronavirus/2019-

• Percent positivity is one of the metrics used to evaluate the prevalence of COVID-19 in a community during a particular

amplification tests (NAATs) by the total number of NAATs administered, then multiplying by 100 [(# of positive NAAT

period. It may be used in public health surveillance and to guide policy determinations made by state, local, and

territorial public health officials. Percent positivity is calculated by dividing the number of positive nucleic acid

Population Estimates Program (2019 Vintage). Rates per 100,000 are calculated as the total cases or deaths per 100,000 people using the <u>US Census Bureau Population Estimates Program</u> (2019 Vintage). Zero values for cases/deaths are subject to change due to reduced frequency of state reporting and subsequent adjustments that may occur. The 7-day case/death averages therefore may be artificially low over the weekend before adjustment to these zero values. **Data Sources, References & Notes:** • The case classifications for COVID-19, a nationally notifiable disease, are described in an <u>updated COVID-19</u> position statement and case definition issued by the Council of State and Territorial Epidemiologists. However, there is some variation in how jurisdictions implement these case classifications. More information on how CDC collects COVID-19 case surveillance data can be found at FAQ: COVID-19 Data and Surveillance. • Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial jurisdictions to the Centers for Disease Control and Prevention (CDC) since January 21, 2020, with the exception of persons repatriated to

Event date (the date of specimen collection, confirmed COVID-19 laboratory test result, or clinical diagnosis): None Report date (when the event was reported to the health department or reported by the health department to CDC): Alabama, American Samoa, Arkansas, California, Colorado, Connecticut, Delaware, District of Columbia, Federated States of Micronesia, Florida, Georgia, Guam, Hawaii, Idaho, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Maryland, Minnesota, Montana, Nevada, New Hampshire, New Mexico, New York (excluding NYC), North Dakota, Ohio, Oregon, Palau, Puerto Rico, Republic of Marshall Islands, Rhode Island, South Carolina, South Dakota, Tennessee, Texas, U.S. Virgin Islands, Utah, Virginia, Washington, West Virginia, Wisconsin, Wyoming • A combination of event date and report date: Alaska, Arizona, Kentucky, Massachusetts, Michigan, Mississippi, Missouri, Nebraska, New Jersey, New York City, North Carolina, Northern Mariana Islands, Oklahoma, Pennsylvania,

with each jurisdiction.

Date of death: Florida, North Carolina

data validation and standard maintenance procedures. **Testing Data** • The data represent COVID-19 Nucleic Acid Amplification Test (NAAT) results, which include reverse transcriptasepolymerase chain reaction (RT-PCR) tests from laboratories in the United States, including commercial and reference laboratories, public health laboratories, hospital laboratories, and other testing locations. The data represent laboratory test totals-not individual people-and exclude antibody and antigen tests. The data are provisional and subject to change. National total test counts reflect the latest reported data from states and may not match the sum of the data presented for all jurisdictions. The data may also not include results from all testing sites within a jurisdiction (e.g., point-of-care test sites) and therefore reflect the majority, but not all, COVID-19 NAATs in the United States.
