variation in how jurisdictions implement these case classifications. More information on how CDC collects COVID-19 case surveillance data can be found at FAQ: COVID-19 Data and Surveillance. • Total cases are based on aggregate counts of COVID-19 cases reported by state and territorial jurisdictions to the Centers for Disease Control and Prevention (CDC) since January 21, 2020, with the exception of persons repatriated to the United States from Wuhan, China, and Japan. All displayed counts include confirmed COVID-19 cases and deaths as reported by U.S. states, U.S. territories, New York City (NYC), and the District of Columbia from the previous day. In accordance with the CSTE definition of COVID-19 cases and deaths, counts for many jurisdictions include both confirmed and probable COVID-19 cases and deaths. COVID-19 case and death data that are not available to CDC are

denoted by N/A. For aggregate state-level data, CDC calculates the number of new cases or deaths each day either by

The number of historical cases and deaths presented on CDC's website reflects the information provided by the states

and jurisdictions. Thus, data may reflect either the date the case or death occurred or the date it was recorded in the

state. Provision of historical cases and deaths by jurisdictions can influence new case and death numbers and 7-day

jurisdiction (e.g., point-of-care test sites) and therefore reflect the majority, but not all, COVID-19 NAATs in the United States. Information about how laboratory data are reported to CDC can be found at: https://www.cdc.gov/coronavirus/2019-ncov/lab/reporting-lab-data.html • Percent positivity is one of the metrics used to evaluate the prevalence of COVID-19 in a community during a particular period. It may be used in public health surveillance and to guide policy determinations made by state, local, and territorial public health officials. Percent positivity is calculated by dividing the number of positive nucleic acid amplification tests (NAATs) by the total number of NAATs administered, then multiplying by 100 [(# of positive NAAT tests / total NAAT tests) x 100]. • On September 30th, 2021, CDC moved to presenting the NAAT testing data with a 7-day lag for testing volume and a

3-day lag for percent positivity to better align with other CDC products. This 3-day lag for percent positivity was
