Please note that jurisdictional reporting methods are subject to change. These changes can cause artificial data fluctuations

on COVID Data Tracker. For example, when jurisdictions opt to report death data by date of death instead of report date, it

may appear that overall deaths from COVID-19 are decreasing. This does not reflect a true decline and data should be

October 25, 2021: CDC stopped spreading aggregate COVID-19 case and death counts evenly over jurisdictions' non-

the quality of data visualizations. This update was made to avoid under-reporting of weekend averages.

States. Information about how laboratory data are reported to CDC can be found at:

reporting days (i.e., smoothing), which had been done to reflect case and death trends across those days and to improve

March 30, 2022: The increases observed in Rhode Island's COVID-19 death counts on 2/20/2021 and 3/2/2022 are due to

• The data represent COVID-19 Nucleic Acid Amplification Test (NAAT) results, which include reverse transcriptase-

laboratories, public health laboratories, hospital laboratories, and other testing locations. The data represent

of the data presented for all jurisdictions. The data may also not include results from all testing sites within a

laboratory test totals-not individual people-and exclude antibody and antigen tests. The data are provisional and

polymerase chain reaction (RT-PCR) tests from laboratories in the United States, including commercial and reference

subject to change. National total test counts reflect the latest reported data from states and may not match the sum

jurisdiction (e.g., point-of-care test sites) and therefore reflect the majority, but not all, COVID-19 NAATs in the United

Puerto Rico, Republic of Marshall Islands, Rhode Island, South Carolina, South Dakota, Tennessee, U.S. Virgin Islands,

https://www.cdc.gov/coronavirus/2019-ncov/lab/reporting-lab-data.html • Percent positivity is one of the metrics used to evaluate the prevalence of COVID-19 in a community during a particular period. It may be used in public health surveillance and to guide policy determinations made by state, local, and territorial public health officials. Percent positivity is calculated by dividing the number of positive nucleic acid amplification tests (NAATs) by the total number of NAATs administered, then multiplying by 100 [(# of positive NAAT tests / total NAAT tests) x 100]. • On September 30th, 2021, CDC moved to presenting the NAAT testing data with a 7-day lag for testing volume and a 3-day lag for percent positivity to better align with other CDC products. This 3-day lag for percent positivity was implemented for all NAAT percent positivity metrics presented on COVID Data Tracker. • Testing Data update for February 22, 2022: IA has incomplete negative test result data, impacting testing volumes and percent positivity.

• Testing Data update for April 26, 2021: WA has incomplete negative test result data from Sep 1, 2021 - Jan 31, 2022,
