

Acute Flaccid Myelitis (AFM)

AFM Cases and Outbreaks

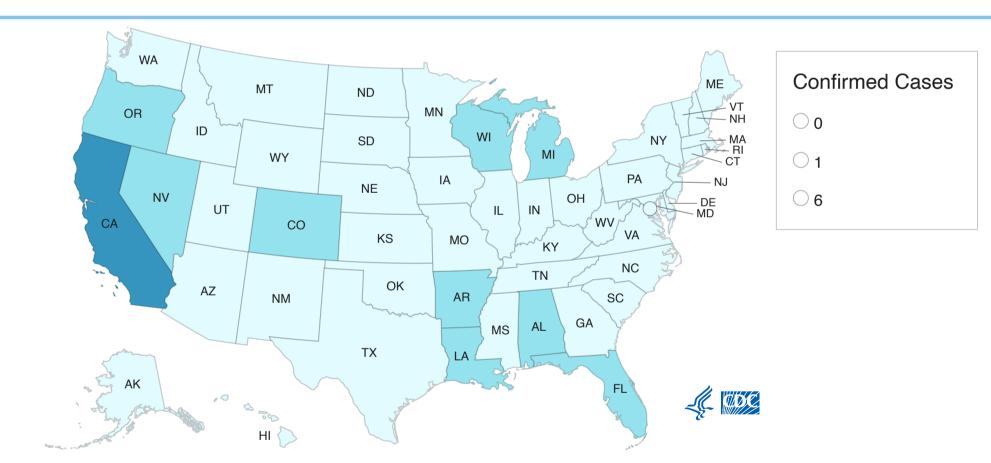

As of September 21 2022, there have been 15 confirmed cases in 2022 out of 45 reports of patients under investigation (PUIs).

There have been **694 confirmed cases** since CDC began tracking AFM in August of 2014. CDC has been thoroughly investigating cases since that time. We have seen increases in AFM cases, mostly in young children, in 2014, 2016 and 2018.

Annual AFM Cases by State

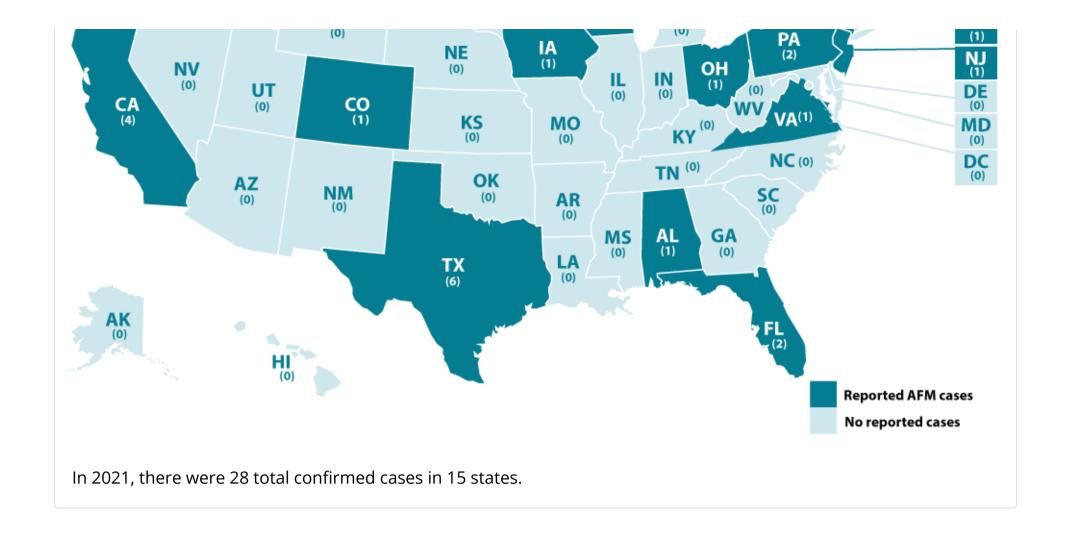

Annual maps represent only cases for whom information was sent to and confirmed by CDC as of September 21, 2022. Patients under investigation are still being classified, and the case counts are subject to change. Cases of AFM have occurred in 49 states and the District of Columbia.

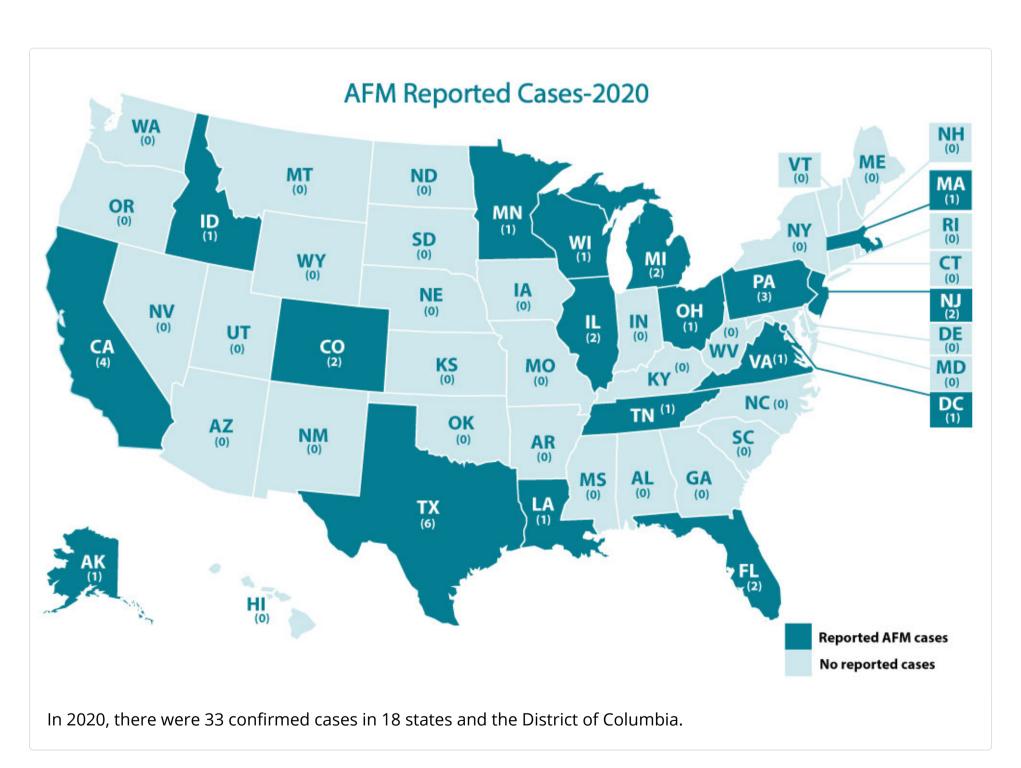

AFM Confirmed Cases 2022

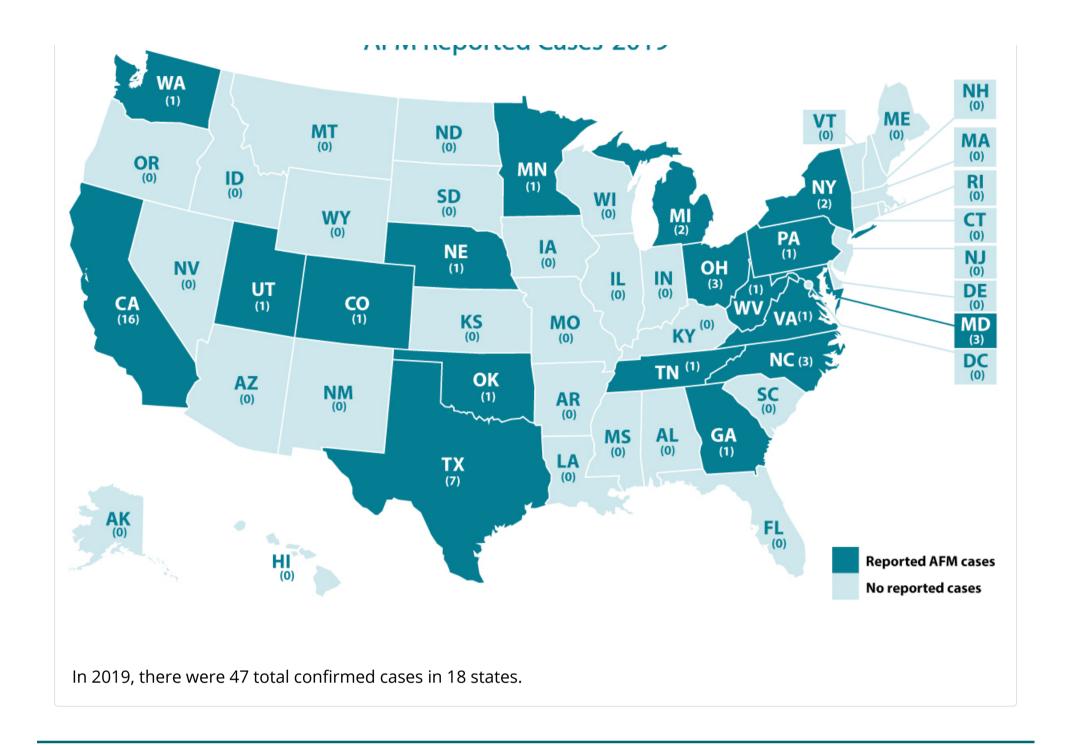

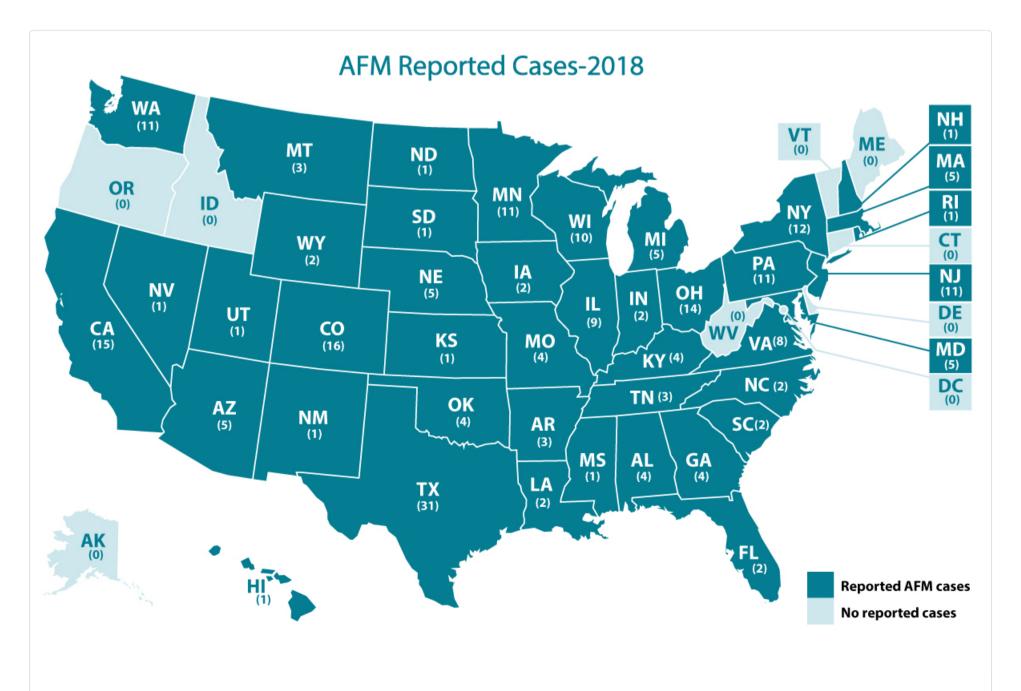

As of September 21, 2022, there have been 15 confirmed cases in 10 states.

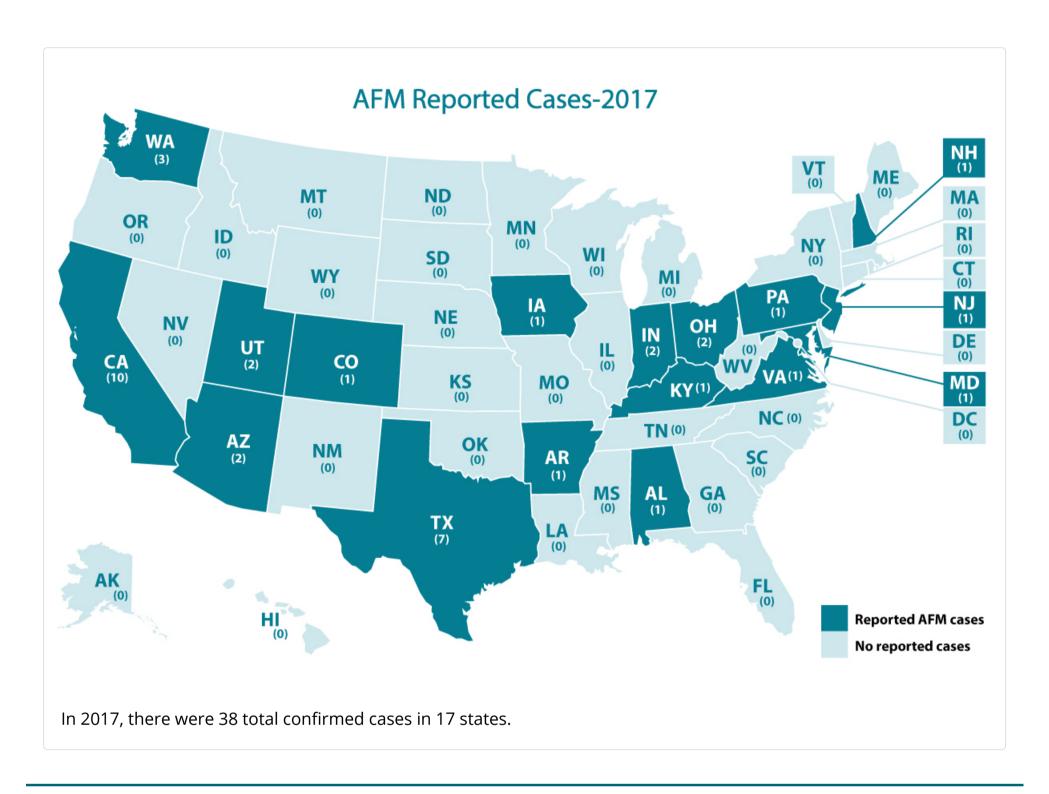

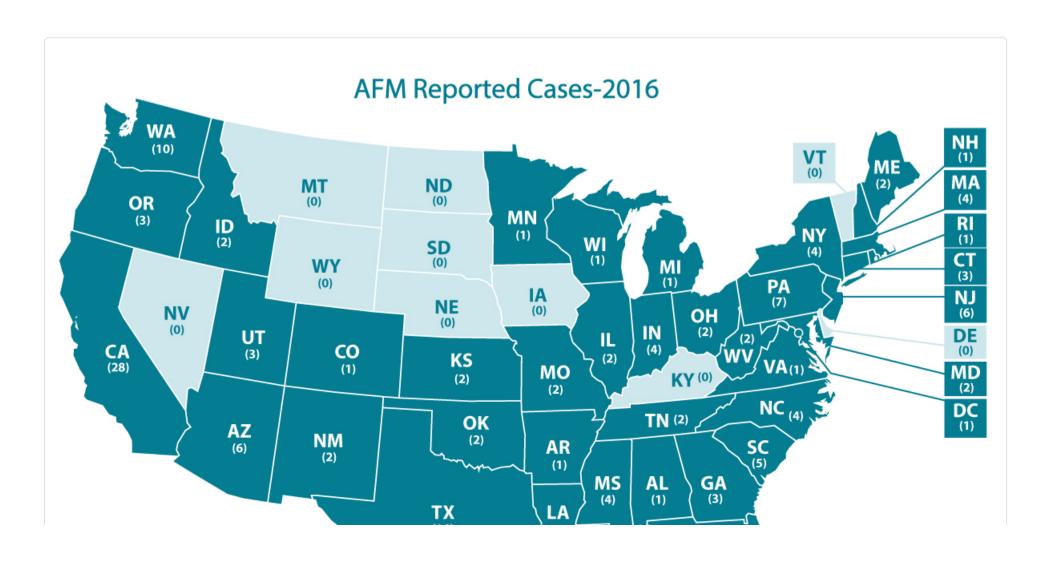

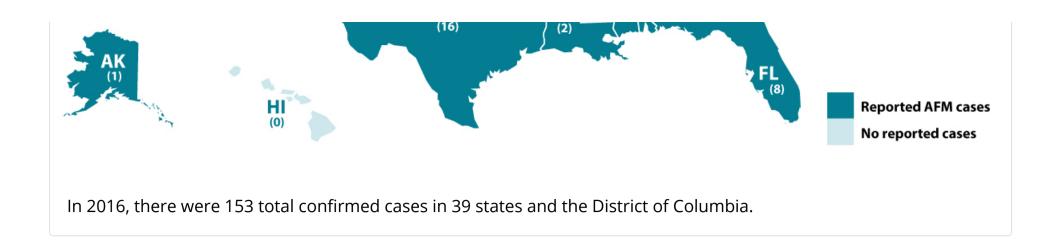

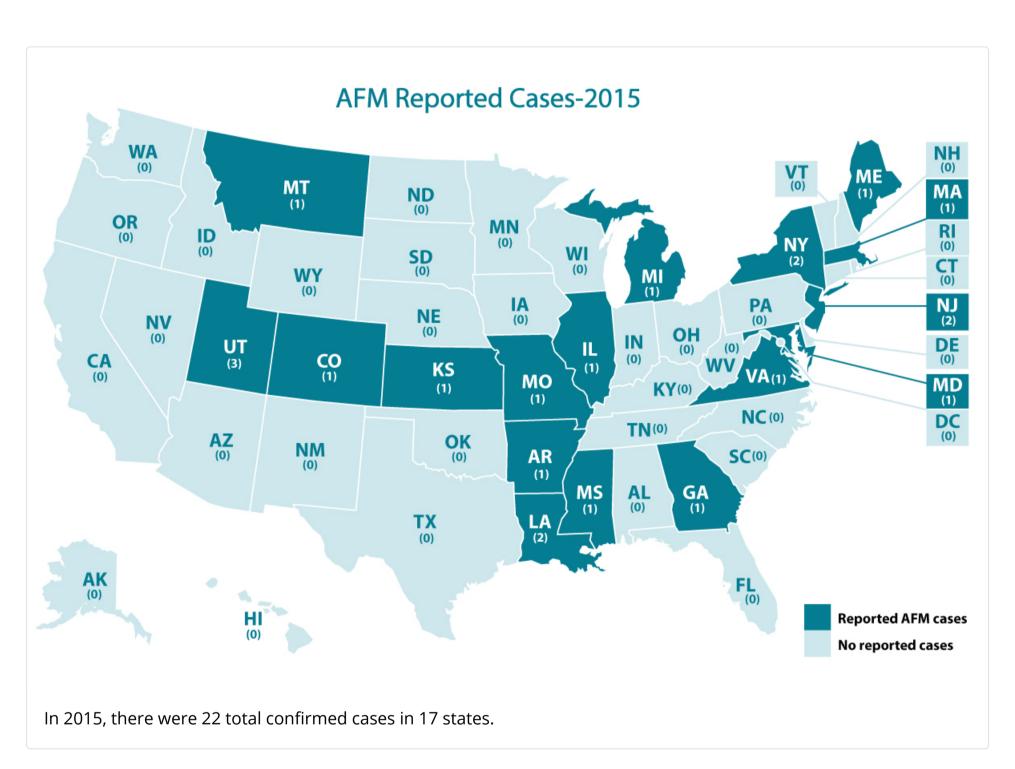

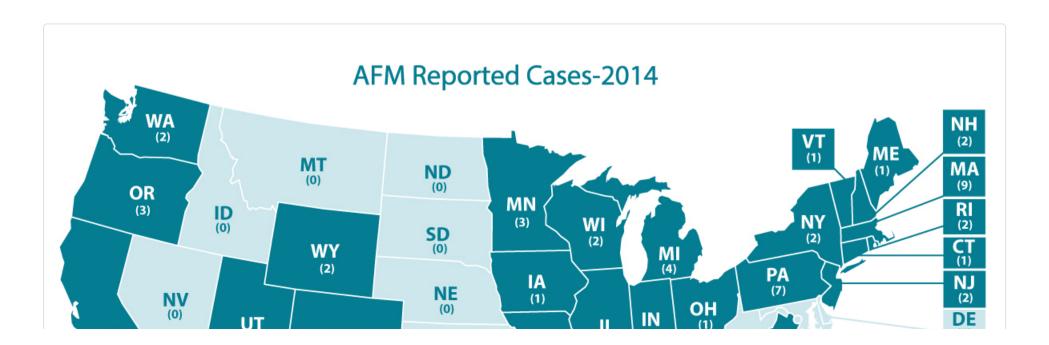

In 2018, there were 238 total confirmed cases in 42 states. One of the confirmed cases is a foreign resident (based

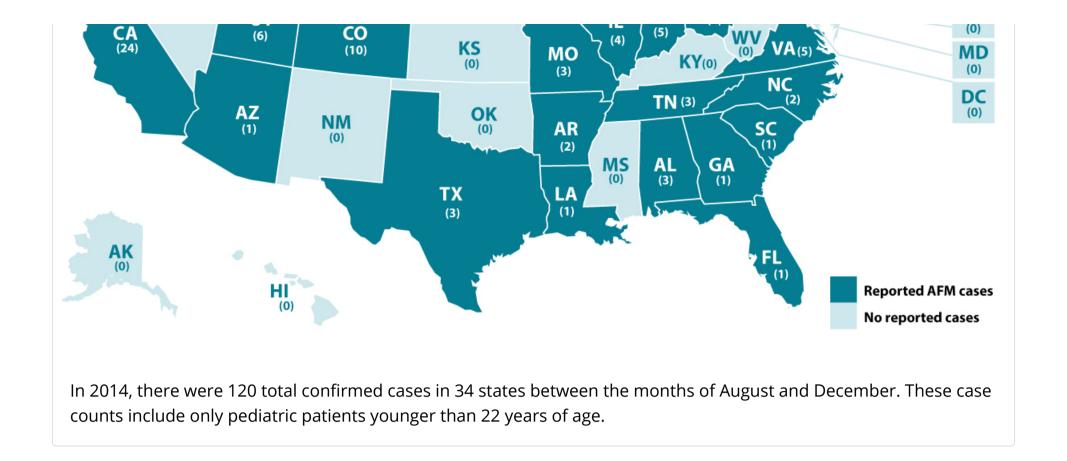

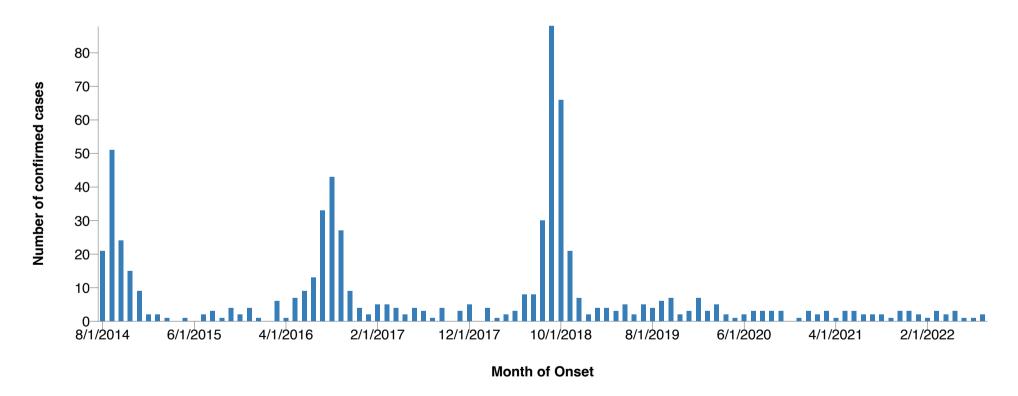

We defer to the states to release additional information on cases as they choose.

Cases by Month, 2014-2022

Most patients developed AFM between August and November, with increases in AFM cases in 2014, 2016, and 2018. Many viruses commonly circulate at this same time of year, including enteroviruses, which are likely responsible for the increase in cases in peak years.

Confirmed AFM cases by CDC

Confirmed cases of AFM by month of illness onset. Case Counts are subject to change.

- ^ Confirmed AFM cases by CDC from August 2014 through September 21, 2022. Case counts are subject to change.
- * The data shown from August 2014 to July 2015 are based on the AFM investigation case definition: onset of acute limb weakness on or after August 1, 2014, and a magnetic resonance image (MRI) showing a spinal cord lesion largely restricted to gray matter in a patient age ≤21 years.
- † The data shown from August 2015 to present are based on the AFM case definition adopted by the Council of State and Territorial Epidemiologists (CSTE): acute onset of focal or flaccid limb weakness and an MRI showing spinal cord lesion largely restricted to gray matter and spanning one or more spinal segments, regardless of age.
