# Forecasts of Flu Hospitalizations

Updated March 1, 2023

Reported and forecasted new influenza hospitalizations as of February 28, 2023.

Interpretation of National Forecasts of New Hospitalizations

- This week's ensemble predicts that the number of new weekly confirmed influenza hospital admissions will remain stable or have an uncertain trend nationally, with **300 to 2,900** new confirmed influenza hospital admissions likely reported in the week ending March 11, 2023.

- This week, 20 modeling groups contributed 21 forecasts that were eligible for inclusion in the ensemble forecasts for at least one jurisdiction. Contributing teams are listed below.

- Ensemble forecasts combine forecasts from diverse models into one forecast. They have been among the most reliable forecasts in performance for previous influenza and COVID-19 forecasting efforts, but even the ensemble forecasts may not reliably predict rapid changes. See COVID-19 Guidance for Hospital Reporting and FAQs 📄 [669 KB, 52 pages] ↗ for additional details on this guidance.

State Forecasts

State-level forecasts show the predicted number of new influenza hospital admissions per week for the next 2 weeks by state. Each state forecast figure uses a different scale due to differences in the number of new influenza hospital admissions per week between states and only forecasts included in the ensemble are shown. Plots of the state-level ensemble forecasts and the underlying data can be downloaded below.
