Epidemiologic Notes and Reports

## Acute Hemorrhagic Conjunctivitis - Florida, North Carolina

The following reports summarize the most recent findings on acute hemorrhagic conjunctivitis (AHC) in Florida (1-3) and also in North Carolina.

Florida: In the period September 8 -October 9 , more than 3,500 cases of illness compatible with AHC were reported to the Dade County Health Department, Miami, Florida. Demographic data have been collected for approximately 1,000 cases: these patients range in age from 7 days to 85 years; $92 \%$ are black, $4.8 \%$ are white, and $2.5 \%$ are Spanish; the female:male ratio is 1.4:1. Seventy-two percent of these patients had onset of illness before September 25. Although AHC has been identified in every area of Dade County, most patients with reported cases reside in a poor, predominantly black section of northwest Miami. Active surveillance continues in schools, clinics, emergency rooms, and offices of private physicians; between 50-100 cases per week continued to be reported through the week ending October 9 .

In the period September 4-October 9, 732 cases of AHC were reported to the Monroe County Health Department. Although the outbreak was initially confined to a small geographic area within Key West, Florida, substantial transmission to other areas has occurred. Approximately 20 cases continue to be reported daily.

Illness compatible with AHC has also been reported in 8 other counties in southern Florida. Most of these patients reside in Broward County, where 929 cases ( 783 children, 146 adults) were reported between September 22-October 9.

North Carolina: An outbreak of AHC has also occurred in a migrant-worker camp in eastern North Carolina. Two Haitian migrant workers had onset of illness on September 25, 1 day after returning from a visit to Miami; both men gave a history of exposure to a number of Miami residents with conjunctivitis. Between September 25-30, AHC was diagnosed for 18 of 25 Haitian workers who were housed in the same compound with patients with index cases. Sixty non-Haitian personnel, housed in separate facilities, were unaffected. No further cases have been reported.

Aside from a 12-year-old girl who developed Bell's palsy temporally associated with AHC, no neurologic complications have been reported associated with AHC from the outbreak areas. Secondary bacterial conjunctivitis has been documented in less than $1 \%$ of reported cases.
Reported by RA Morgan, MD, MPH, MB Enriquez, MD, MPH, Dade County Health Dept, RK Forster, MD, V Sklar, MD, D Bode, MD, W Culbertson, MD, F Zafar, MD, J Ehrenkranz, MD, Miami, J Easton, ARNP, HO Garcia, MD, Monroe County Health Unit, PW Hughes, MD, MPH, C Braynon, RN, MPH, Broward County Health Dept, RA Gunn, MD, MPH, State Epidemiologist, Dept of Health and Rehabilitative Svcs, Florida; JE Holland, MD, Wilson, TR Perry, Wilson County Health Dept, JN MacCormack, MD, MPH, MP Hines, DVM, MPH, State Epidemiologist, Dept of Human Resources, North Carolina; Viral Diseases Div, Center for Infectious Diseases, Field Services Div, Epidemiology Program Office, CDC.

## Hemorrhagic Conjunctivitis - Continued

Editorial Note: The clinical and epidemiologic features of AHC in the United States appear similar to those reported in other countries $(4,5)$, and include affliction of all age groups, a short incubation period, rapid secondary transmission in crowded settings, lack of systemic symptoms and signs, and resolution within 4 to 10 days. The outbreak in southern Florida appears to have declined in some areas, but transmission still continues to occur in all affected areas. Surveillance for AHC should be continued among persons exposed to ill persons in Miami or Key West; cases that occur in other parts of Florida and possibly other states should be reported to local or state health departments.

Factors influencing the occurrence and spread of AHC in the United States, including seasonal conditions, remain unknown. Exclusion of persons with suspected AHC from school or work in Dade and Monroe Counties may have curtailed the geographic spread of illness, but may have increased attack rates within affected families. Factors which may contribute to intra-familial spread, including hygienic practices, are presently being assessed in retrospective case-control studies in Miami and Key West.

## Age Characteristics of Measles Cases - United States, 1977-1980

In the period 1977-1980, the reported annual measles incidence decreased 77\% from 26.5 cases $/ 100,000$ total population to 6.0 cases $/ 100,000$ total population (Table 1). In the same period, the proportion of measles cases for which age was reported increased substantially. In 1977, age data were available on $72.5 \%$ of all reported measles cases, whereas in 1980, age data were available on $96.5 \%$ of reported measles cases.

In the period 1977-1980, the highest proportion of cases was reported for 10- to 14 -year olds, who accounted for more than $25 \%$ of cases each year. Persons $\geqslant 10$ years of age accounted for approximately $60 \%$ of reported cases in all 4 years. The percentage of cases among children < 5 years of age rose from $14.1 \%$ in 1977 to $20.5 \%$ in 1980.

The estimated age-specific incidence of measles for each age group diminished substantially in 1977-1980, and ranged from a 53.3\% reduction for persons $\geqslant 20$ years to an $81.1 \%$ reduction for 5 - to 9 -year olds.
Reported by the Surveillance and Assessment Br, Immunization Div, Center for Prevention Svcs, CDC.

## Measles - Continued

Editorial Note: The essentially complete reporting of age in 1980 for measles cases reflects the efforts of state and local health officials to eliminate measles by assuring that every measles case that is reported is investigated.

The estimated age-specific data on the incidence of measles indicate a dramatic decline in incidence for all age groups in 1977-1980. The incidence of measles in 1980 was relatively comparable for all age groups from 0 to 19 years. This pattern was also observed in 1979. There has been a reversal of the trend noted in 1973-1977 of rising incidence of measles among 10-to-14 and 15-to-19 year olds (1). This decline in the incidence of measles has been associated with the National Childhood Immunization Initiative of 1977-1979 and the Measles Elimination Program that began in 1978 and has the stated goal of eliminating indigenous measles from the United States by October 1, 1982 (2).

## International Notes

## Supplementary Feeding Programs - Somalia

In May 1980, protein-energy undernutrition was identified as the predominant refugee health problem in Somalia (1). Supplementary feeding programs (SFPs) were instituted in refugee camps to rehabilitate undernourished persons, protect nutritionally vulnerable groups, and establish procedures for continuous surveillance of individual and population nutritional status (2). Follow-up surveys conducted in September 1980 demonstrated a decrease in the overall prevalence of undernutrition-from 21\%-28\% to 6\%-18\% (3).

Under general guidelines promulgated by the Ministry of Health of Somalia, SFPs are being implemented in each camp. Eligible persons include children $\leqslant 5$ years old whose weight for height is $\leqslant 80 \%$ of the median standard weight for height* (4), pregnant women and lactating women, patients with clinically diagnosed tuberculosis, and persons with other illnesses. SFP procedures include providing cooked rations, on-the-spot feeding, periodic assessment of those enrolled, and continued active and passive surveillance. Children are retained in the program until they reach $85 \%$ median weight for height; pregnant women are enrolled during their third trimester and discharged 6 to 12 months postpartum; and tuberculous patients are retained until they have completed drug therapy.

In July 1980, 21,901 refugees in Somalia were enrolled in SFPs. By October of the same year, SFP enrollments had increased $85 \%$ to 40,492 , while the refugee population increased $13 \%$. Ninety-three percent of the increase in enrollment represented children $\leqslant 5$ years old. The Northwest Region had an SFP enrollment rate of $124 \dagger$ per 1,000 refugee population compared with 27 and 26 per 1,000 in Hiran and Gedo, respectively. $\ddagger$

[^1]
## Feeding Programs - Continued

In February 1981, the Somali Ministry of Health evaluated SFPs in the Northwest Region to assess the nutritional status of children already enrolled. Because the enrollment criterion for an SFP was set at $70 \%-80 \%$ median weight for height, this range served as a standard to measure an SFP's progress. In Saba'ad, a camp established in November 1979, 1.643 children were enrolled in the SFP. Of the total enrollment, 1,006 children ( $61 \%$ ) attended a supplementary morning or afternoon feeding session at least once during the survey and were weighed and measured. The results indicated that $53 \%$ of these children exceeded the discharge level of $85 \%$ median weight for height, and $26 \%$ were in the $80 \%-84 \%$ category. In Adi Addeys, a camp opened in December 1980, 42\% of 2,069 enrollees exceeded the discharge level.

In order to determine the impact of SFPs on the nutritional status of children in a refugee camp, a third survey was conducted at Daray Ma'an camp, Northwest Region. This camp had been operating for 6 months, had an active SFP, but had had logistical problems with general ration deliveries. A random sample of 495 children $\leqslant 110 \mathrm{~cm}$ in height from the camp population was evaluated. Results of the survey include the following: 1) 174 (35\%) were $\leqslant 80 \%$ median weight for height, indicating a high prevalence of undernutrition in the camp; 2) 216 (44\%) of the 495 children were already enrolled in an SFP, indicating that the prevalence of undernutrition was not due to SFP underenrollment; 3) many children enrolled in the SFP had gained weight-114 (53\%) of the 216 enrollees exceeded the $85 \%$ discharge level; 4) many undernourished children in the camp were probably not being successfully identified-only

## Feeding Programs - Continued

$60 \%$ of those surveyed who were $\leqslant 80 \%$ median weight for height were enrolled in the SFP. Despite the active SFP (4,646 total enrollment), the prevalence of undernutrition among the children at Daray Ma' an had not yet been substantially reduced.

The usual enrollment method for SFPs is passive; that is, refugees are asked to bring their children to a central location to be weighed and measured. When an active search was later performed in each refugee household in Adi Addeys, enrollment in the SFP rose by $15 \%$. This search effectively identified the severely undernourished who had not already been enrolled in an SFP (Table 2).
Reported by SH Musa, MD, CO Nuur, MD, Refugee Health Unit, Mogadishu, Somalia; A Deria, MD, World Health Organization; International Health Program Office, Epidemiology Program Office, CDC.
Editorial Note: In order to attain its objective and to use available resources optimally, a supplementary feeding program (SFP) should be a dynamic system-a continuous process of enrolling new eligible persons, monitoring weight gain, and discharging children who have. gained enough weight. As a refugee camp population stabilizes and the general system of obtaining rations improves, the composition of SFP enrollment will probably change. The percentage of children enrolled should decline as they complete the program, leaving a longerterm core of pregnant and lactating women and tuberculous patients.

The program evaluations described here measure weight changes among SFP enrollees and the impact of the SFP on nutritional status in the camp. Many factors contribute to a child's failure to gain weight while enrolled in an SFP, e.g., irregular attendance, inadequate general ration supply, intercurrent infection, and improper food preparation.

Between July and October 1980, a sharp increase in SFP enrollment occurred as a result of efforts to focus on undernutrition-especially among children. This, in turn, led to the suspension of periodic assessments in the SFPs and of continued camp surveillance.

Under the current system, large numbers of children who had reached the discharge level of $85 \%$ median weight for height were continuing to be fed, and $40 \%$ of eligible children were not being identified - thereby minimizing the impact of the SFP on the nutritional status in the camp population. As a result of these surveys, the SFPs have begun to adhere to discharge criteria and to incorporate active surveillance methods.

## Current Trends

## Urban Rat Control-United States

In the third quarter of fiscal year 1981, urban rat control programs in 59 communities identified 936 environmentally improved blocks (EIB) and achieved maintenance in 1,618 blocks. As a result, an additional 250,000 people now live in neighborhoods that are rat free (Table 3).

Urban rat-control target areas usually are the communities' most affected areas, and local programs eliminate rat infestations by permanently reducing the existing underlying environmental deterioration. Program services usually include 1) one-on-one resident information and education promoting premises sanitation and neighborhood clean-up, 2) improvement of municipal services and codes, 3) clean-up campaigns, 4) supplemental rat killing, and 5) interagency coordination of local rat-control-related activities and resources. During the quarter, these services were provided for over 3 million residents living on over 21,000 target area blocks.

As of June 30, 1981, programs had delivered services in approximately 60,000 blocks, of which almost 40,000 were EIB. Over 7.3 million people now live in neighborhoods that are rat free.
Reported by the Environmental Health Services Div, Center for Environmental Health, CDC.

*Contiguous blocks where maintenance has been achieved and sustained for a minimum of 12 months.
These blocks are no longer part of the approved project target area.
tNortheastern Pennsylvania Vector Control Association. Serves Lackawanna and Luzerne countries and the cities of Nanticoke, Wilkes-Barre, and Hazleton.
$\neq$ Target-area blocks are confined to public housing projects.

The Morbidity and Mortality Weekly Report, circulation 96,000 , is published by the Centers for Disease Control, Atlanta, Georgia. The data in this report are provisional, based on weekly telegraphs to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday.

The editor welcomes accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials. Send reports to: Attn: Editor, Morbidity and Mortality Weekly Report, Centers for Disease Control, Atlanta, Georgia 30333.

Send mailing list additions, deletions and address changes to: Attn: Distribution Services, Management Analysis and Services Office, 1-SB-419, Centers for Disease Contral, Atlanta, Georgia 30333. When requesting changes be sure to give your former address, including zip code and mailing list code number, or send an old address label.

[^0]:    

[^1]:    *Based on Harvard reference population, as recommended by the Ministry of Health.
    tlf Las Dhure camp (where $18 \%$ of the camp population was enrolled in a crash feeding program) is excluded, the SFP enrollment rate for the Northwest Region becomes 96 per 1,000.
    $\ddagger$ The enrollment rates are based on estimated camp populations released by the National Refugee Commission. Although estimation inaccuracies affect the absolute value, rates are useful for making regional and temporal comparisons.

[^2]:    All delayed reports and corrections will be included in the following week's cumulative totals.

[^3]:    *Mortality data in this table are voluntarily reported from 121 cities in the United States, most of which have populations of 100.000 or more. A death is
    reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not included.

    - P Pneumonia and influenza
    tBecause of changes in reporting methods in these 4 Pennsylvania cities, these numbers are partial counts for the current week. Complete counts will
    be available in 4 to 6 weeks.
    $\uparrow$ t Total includes unknown ages.

[^4]:    *Harvard Standards.
