

Pease International Tradeport, NH

The Pease Study: PFAS Health Effects

INFORMATION TO PROTECT OUR COMMUNITIES

The Centers for Disease Control and Prevention (CDC) and the Agency for Toxic Substances and Disease Registry (ATSDR) are studying the **health effects from drinking PFAS** (perand polyfluoroalkyl substances)-**contaminated water** in the Portsmouth, New Hampshire area.

- In April and May 2014, tests found PFAS in drinking water from Pease International Tradeport Public Water System (PWS).
- You may be able to participate in the study if you live or have lived in or near Portsmouth, NH and meet eligibility criteria.

Why are CDC and ATSDR doing a study on PFAS in Portsmouth and the surrounding areas?

Portsmouth, New Hampshire and the surrounding areas were selected for the study because residents were exposed to drinking water that contained PFAS.

CDC and ATSDR are recruiting participants for a study to evaluate their PFAS blood levels, health measures like cholesterol levels and thyroid function, and medical history to learn how PFAS may affect health.

CDC and ATSDR want to understand more about PFAS human health effects since little is known and because some studies have shown that PFAS may harm human health.

Who may be eligible for the health study?

Some of the eligibility criteria includes:

An adult aged 18 or older who

- worked or attended school at Pease International Tradeport anytime from January 2004 to May 2014, or
- lived in Newington at anytime from January 2004 to the present and used a private well with documented PFAS contamination.

A child aged **4 through 17** who has parent or guardian permission and

- attended daycare at Pease International Tradeport at anytime from January 2004 to May 2014, or
- was born to and/or breastfed by a mother who meets the adult eligibility criteria.

A small group of adults and children who do not meet the criteria above may also be eligible to participate. Eligibility will be screened through the Pease Study call center.

What are PFAS?

PFAS are human-made chemicals used since the 1950s in a variety of products, including some cosmetics; water, grease, and oil-resistant products; and firefighting foam. Scientists are still learning how PFAS exposure affects human health, but research involving humans suggests that high levels of certain PFAS **may** lead to the following:

- Increased cholesterol levels
- Changes in liver enzymes
- Decreased vaccine response in children
- Increased risk of high blood pressure or preeclampsia in pregnant women
- Small decreases in infant birth weights
- Increased risk of kidney or testicular cancer

How did PFAS get into drinking water?

PFAS containing aqueous film-forming foam (AFFF) may have gotten into public and private wells during firefighting and firefighting training on the former Pease Air Force Base. When the City of Portsmouth learned of PFAS water contamination, it closed the most contaminated well supplying the Pease Tradeport drinking water system May 2014.

What types of tests will Pease Study researchers do?

Trained health professionals will be:

- Testing blood and urine samples;
- Taking body measurements;
- Asking about medical history; and
- Studying behaviors in child participants.

How are participant's results handled?

 CDC and ATSDR are careful to protect personal information and conceal every participant's identity.

Who analyzes test results?

 Researchers will analyze test results to learn more about the possible health effects of PFAS exposure.

When will the results be available?

 After the study ends and the results are analyzed, CDC and ATSDR will share results as soon as possible and will write and share a report with the public.

What are some benefits to Pease Study participants?

Participants will:

- Help scientists understand how PFAS affect health.
- Receive their individual test results, which they can share with their doctors to monitor their health.
- Receive up to \$75 in gift cards for completing the entire study.

Do you want to know more?

For general information about PFAS or the Pease Study you can:

Visit https://www.atsdr.cdc.gov/pfas/Pease-Study.html

Call: 1-800-CDC-INFO (232-4636)

Email: PeaseStudy@cdc.gov

To see if you are eligible to participate in the Pease Study, you can call the Pease Study call center beginning October 25, 2019. The number is: 603-846-6192. The call center will screen you for eligibility and provide information on next steps.
