

SAND & GRAVEL OPERATOR MINING FACTS – 2007

Mining Operations

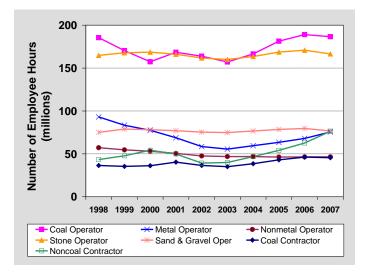

In 2007, a total of 7,199 sand and gravel mining operations reported employment to the Mine Safety and Health Administration (MSHA).¹

- Sand and gravel mines were the largest mining sector, comprising 48.4% of all mining operations.
- Sand and gravel mines were found throughout all 50 states and Puerto Rico.

Employees

A total of 45,761 employees,² corresponding to 38,340 full-time equivalent (FTE)³ employees, were reported by sand and gravel mine operators.

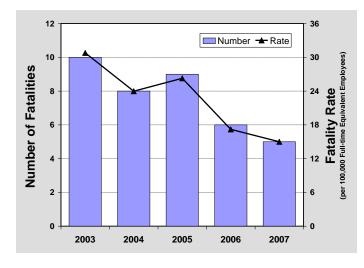

• Within the mining sectors,⁴ sand and gravel mine operator employees accounted for 11.4% of all employee hours reported to MSHA.

Fatalities

Five work-related fatalities occurred among sand and gravel operator employees in 2007. This compared to six fatalities in 2006.

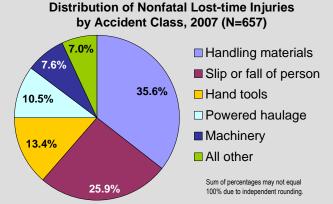

- The sand and gravel mine operator fatality rate was 15.0 fatalities per 100,000 FTE employees.
- Powered haulage was associated with 60% (n=3) of sand and gravel fatalities.

Nonfatal Lost-time Injuries

There were 657 nonfatal lost-time injuries among sand and gravel operator employees occurring at an overall rate of 2.0 injuries per 100 FTE employees. A total of 30,440 days lost from work⁵ resulted from these injuries.

- The most frequent classifications of nonfatal lost-time injuries for sand and gravel operator employees involved handling materials (n=234; 35.6%) and slip or fall of person (n=170; 25.9%).
- Sprains and strains were the most frequently reported nature of injury (n=241; 36.7%).
- The back was the most frequently reported body part injured (n=124; 18.9%) followed by fingers (n=105; 16.0%). Back injuries represented 10,808 days lost from work; finger injuries represented 2,880 days lost.

Note: "Fall of ground" includes MSHA's Accident/Injury/Illness class for fall of face, rib, pillar, side, or highwall; fall of roof, back, or brow; and machinery cases when the source of injury was caving rock, coal, ore, or waste.

Data source: Publicly released data files of employment and accident/injury/illness collected by MSHA under 30 CFR 50.

Notes: All analyses of accident data exclude office employees. Occupational fatalities exclude all cases under 17 years of age. Further statistical methodology is available on the NIOSH Internet [<u>http://www.cdc.gov/niosh/mining/statistics/method.htm</u>]. Data in the above tables may not add to totals shown because of independent rounding. Caution should be used when interpreting rates based on a small number of events.

¹Mines at which only independent contractors were working did not show any employment and were not counted.

²Average number of employees working at individual mines during calendar quarters of active operations (includes office workers).

³Full-time equivalent employees computed using reported employee hours (2,000 hours = 1 FTE).

⁴Mining sectors include coal operators, metal operators, nonmetal operators, stone operators, sand and gravel operators, coal contractors, and noncoal contractors.

⁵Includes actual days away from work and/or days of restricted work activity. For permanently disabling injuries only, statutory days charged by MSHA were used if they exceeded the total lost workdays.
