

West Nile Virus

West Nile Virus

Historic Data (1999-2022)

ArboNET is a national arboviral surveillance system managed by CDC and state health departments. ArboNET collects data on arboviral infections among people, veterinary animals, mosquitoes, dead birds, and sentinel animals.

Limitations of ArboNET Data ^

Surveillance data have several limitations that should be considered when using and interpreting the data.

1. Under-reporting is a limitation common to all surveillance systems that rely on healthcare providers to consider the disease as a possible diagnosis in a patient, obtain the appropriate laboratory test, and report confirmed to public health authorities.
2. Cases of mild illness (non-neuroinvasive disease) are more likely to be underreported compared to more severe disease (neuroinvasive) cases. The degree of underreporting varies by disease awareness and healthcare-seeking behavior in any area. Surveillance data for non-neuroinvasive disease should not be used to make comparisons of disease activity between different locations or over time.
3. Surveillance data are reported by county of residence, not the location (county or state) of exposure.
4. Non-human surveillance is conducted variably across the country. Absence of non-human activity reported to CDC should not be interpreted as no risk.
5. There is a lag in case reporting to CDC and states and territories may publish surveillance data on different schedules than CDC.

Dashboard Instructions & Visuals Included in Each Section ^

The visuals on this dashboard display West Nile virus data from 1999 – 2022.

- The “Cumulative Data for 1999-2022” section displays combined data from this timeframe. This includes:
 - Disease cases by year
 - Disease cases by age and sex
 - Average annual incidence by county
- The “Explore Human Data for 1999-2022” section allows users to filter the data by year and type of case (all disease cases or neuroinvasive disease cases only) using the drop-down list of options. This includes:
 - Number of disease cases, hospitalizations, and deaths
 - Disease cases by month
 - Disease cases by state
- The “Explore County Level Data for 1999-2022” section allows users to filter the data by year using the drop-down list of options. This visualization includes:
 - Human and non-human activity by county

- The data for each visual can also be viewed in table form by clicking on its corresponding data table bar below the figure.

Please note – users may experience *slow load times after selecting filters*. Please *allow the visualizations to fully load after selecting filters*, which will be indicated by an updated visual title.

i The 2022 data are preliminary and subject to change. Data are current as of June 13, 2023.

Data Table - West Nile virus human disease cases by year of illness onset, 1999-2022	
Year	Reported Cases
1999	62
2000	21
2001	66
2002	4,156
2003	9,862
2004	2,539
2005	3,000
2006	4,269
2007	3,630
2008	1,356
2009	720
2010	1,021
2011	712
2012	5,674
2013	2,469
2014	2,205
2015	2,175

Year	Reported Cases
2016	2,149
2017	2,097
2018	2,647
2019	971
2020	731
2021	2,911
2022	1,126

West Nile virus human disease cases by age and sex, 1999-2022

[Download Data \(CSV\)](#)

Data Table - West Nile virus human disease cases by age and sex, 1999-2022		
Age	Male	Female
<18	3.89	2.69
18-29	3.95	3.36
30-39	5.95	5.21
40-49	9.15	7.83
50-59	11.23	8.51
60-69	10.28	6.69
70+	12.62	8.5

West Nile virus human neuroinvasive disease average annual incidence per 100,000 population by county of residence, 1999-2022*

Incidence per 100,000 Population

- 0.01 to 0.16
- 0.17 to 0.37
- 0.38 to 1.09
- >1.10

*For 2022 preliminary data, Maryland reports state level data only; South Carolina reports state level data only for human infections.

Cumulative Data (1999-2022)

Yearly Data

View the total number of human infections reported by county by hovering over the shaded counties below

Non-human activity
 Human infections
 Human infections and non-human activity

*For 2022 preliminary data, Maryland reports state level data only; South Carolina reports state level data only for human infections

About this map:

Non-human activity: Indicates that veterinary disease cases or infections in mosquitoes, birds, or sentinel animals have been reported to CDC.

Human infections: Indicates that human disease cases or infections in blood donors have been reported to CDC.

Human infections and non-human activity: Indicates that both human infections and non-human infections have been reported to CDC.

**Presumptive viremic blood donors (PVD) are people who had no symptoms at the time of donating blood through a blood collection agency, but whose blood tested positive when screened for the presence of West Nile virus. Some PVDs develop symptoms after donation.

Year

2022

View the total number of human infections reported by county by hovering over the shaded counties below

Non-human activity Human infections Human infections and non-human activity

*For 2022 preliminary data, Maryland reports state level data only; South Carolina reports state level data only for human infections

About this map:

Non-human activity: Indicates that veterinary disease cases or infections in mosquitoes, birds, or sentinel animals have been reported to CDC.

Human infections: Indicates that human disease cases or infections in blood donors have been reported to CDC.

Human infections and non-human activity: Indicates that both human infections and non-human infections have been reported to CDC.
