NATIONAL INSTITUTE FOR OCCUPATIONAL SAFETY AND HEALTH

The National Institute for Occupational Safety and Health (NIOSH) is the U.S. federal agency that conducts research and makes recommendations to prevent worker injury and illness. NIOSH research is key to national efforts for preventing worker injuries, illnesses, and deaths and provides practical solutions to identified problems. The Institute’s work in this area protects the safety and health of the nation’s 153 million workers and provides the only dedicated federal investment for research needed to prevent worker injuries and illnesses that cost the United States $250 billion annually. These safety and health risks take huge tolls on workers, their families, businesses, communities, and the nation’s economy; NIOSH works to promote a healthy, safe and capable workforce that can rise to the challenges of the 21st Century.

NIOSH Mission
NIOSH produces new scientific knowledge and provides practical solutions vital to reducing risks of injury and death in traditional industries, such as agriculture, construction, and mining. Of equal importance, NIOSH supports research to predict, prevent, and address emerging problems that arise from dramatic changes in the 21st Century workplace and workforce. NIOSH partners with diverse stakeholders to study how worker injuries, illnesses, and deaths occur. NIOSH scientists design, conduct, and support targeted research, both inside and outside the institute, and support the training of occupational health and safety professionals to build capacity and meet increasing needs for a new generation of skilled practitioners. NIOSH and its partners support U.S. economic strength and growth by moving research into practice through concrete and practical solutions, recommendations, and interventions for the building of a healthy, safe and capable workforce.

NIOSH Origins
The Occupational Safety and Health Act of 1970 established NIOSH. NIOSH partners with the Occupational Safety and Health Administration (OSHA). OSHA is part of the U.S. Department of Labor, and it develops and enforces workplace safety and health regulations. NIOSH is part of the U.S. Centers for Disease Control and Prevention, in the U.S. Department of Health and Human Services. It has the mandate of helping to assure “every man and woman in the National safe and healthful working conditions and to preserve our human resources.” NIOSH has more than 1,200 employees from a diverse set of fields including epidemiology, medicine, nursing, industrial hygiene, safety, psychology, chemistry, statistics, economics, and many branches of engineering.
NIOSH Research

Through the National Occupational Research Agenda (NORA), a public-private partnership, now in its second decade, NIOSH works closely with diverse partners to identify the most critical issues in workplace safety and health. NIOSH and its partners then stimulate and conduct innovative research that addresses needs in a wide range of industries central to our society and economy:

Agriculture, Forestry, and Fishing
A review by independent experts lauded NIOSH for the relevance and impact of its agriculture, forestry, and fishing research and its strategic partnerships in this sector. The report cited accomplishments such as reducing child death rates from agricultural worksite risks, reducing fatalities from tractor rollovers, and adopting life-saving personal flotation devices in commercial fishing.

Construction
NIOSH has completed research projects on the most salient needs of this large and diverse sector and have provided solutions to the construction community. Projects have addressed the causes of falls and electrical hazards, musculoskeletal disorders associated with construction work, and health hazards such as noise, asphalt fumes, silica, and welding fumes.

Healthcare and Social Assistance
NIOSH provides detailed recommendations for workers who serve the sick and those in need of assistance. Partnerships have resulted in development of safe patient handling guidance that minimizes musculoskeletal disorders in nurses, and improvement of facility designs to minimize risks. NIOSH has worked closely with The Joint Commission, which accredits and certifies more than 2,000 healthcare organizations in the U.S., as well as the American Nurses Association. Researchers are now working on a web-based training program on workplace violence prevention for healthcare workers.

Manufacturing
NIOSH has developed and distributed education materials on major hazards in this sector and promote reduction of injuries and fatalities due to contact with equipment, falls, hearing loss, and other exposures. The rapidly developing area of nanotechnology also has the potential to influence large numbers of industrial processes and products and NIOSH is developing key information needed to provide guidance, training materials, and recommendations specific to control worker exposures.

Mining
NIOSH has created engineering controls for reducing noise levels in the mines, proximity detection systems for mining equipment, and LED cap lamps. They have developed practical solutions to critical problem areas in mining, which include providing emergency oxygen through self-contained self-rescuers and improving underground communications and personnel tracking. NIOSH and its partners designed, developed and patented the coal dust explosibility meter and personal dust monitor, both commercially available and used in underground coal mines. Training packages and emergency response protocols for mining companies are being developed to identify and address emerging issues in mine emergency response planning.

Oil and Gas Extraction
NIOSH developed a research program for the upstream oil and gas industry that addresses the major causes of injury and illness among these workers. NIOSH utilized partner worksites to produce two training videos for roughnecks and truckers and developed a set of safety checklists for rig workers. NIOSH continues to work with diverse partners to develop engineering and administrative controls for silica during hydraulic fracturing operations.

Public Safety
NIOSH has built a library of literature addressing law enforcement and wild land firefighting, produced and promoted education materials on safety and health in law enforcement, and continues to expand partnerships. NIOSH published one of the first population-based studies to integrate psychological, physiological, and subclinical measures of stress, disease and mental dysfunction in Annals of Epidemiology, studying the effects of policing and stress. Additionally, recent research published in the Journal of Safety Research describes fatal and non-injury data for correctional officers. NIOSH networks with numerous fire service and law enforcement professionals and continues to promote best practices among public safety workers responding to emergency calls, often in uncontrolled environments.

Services
NIOSH supports workers in service establishments such as automotive repair, hotels, and fast food service. In addition to completing health hazard evaluations, NIOSH has been involved in research programs that address health risks in the education sector. NIOSH conducts research on chemical exposures and associated health effects in workers providing embalming services, and in workers for dry cleaners.

Transportation, Warehousing, and Utilities
NIOSH research and interventions in this sector include guidance for commercial truck drivers, a study of safety ordinances for violence against taxi drivers, reducing musculoskeletal disorders in package drivers and airline baggage handlers, and aviation safety. NIOSH recently established a Center for Motor Vehicle Safety to better find solutions for fatalities and severe injuries in transportation.

Wholesale and Retail Trade
NIOSH has identified emerging issues in this sector and developed products such as alternative keyboards for work posture and a video on practical measures for identifying risk factors for workplace violence. As a result of NIOSH research, nonskid mats were installed for warehouse workers handling liquids, and improved dust exhaust hoods were installed in lumber stores. NIOSH initiated discussions between users and manufacturers of equipment designed to reduce musculoskeletal hazards, an approach that has been adopted by other entities.
