# Forecasts of Flu Hospitalizations

Updated December 1, 2023

## Reported and forecasted new influenza hospital admissions as of November 29, 2023.

### Interpretation of National Forecasts of New Hospitalizations

- This week's ensemble predicts that the number of new weekly laboratory confirmed influenza hospital admissions will likely increase nationally, with **3,300 to 11,000** laboratory confirmed influenza hospital admissions likely reported in the week ending December 16, 2023.
- This week, 23 modeling groups contributed 28 forecasts that were eligible for inclusion in the ensemble forecasts for at least one jurisdiction. Contributing teams are listed below.
- Ensemble forecasts combine forecasts from diverse models into one forecast. They have been among the most reliable forecasts in performance for previous influenza and COVID-19 forecasting efforts, but even the ensemble forecasts may not reliably predict rapid changes.
- The figure shows the number of new laboratory confirmed influenza hospital admissions reported in the United States each week from September 1 through November 25 and forecasted new influenza hospital admissions per week for this week and the next 2 weeks, through December 16. Hospitals are required to report daily laboratory-confirmed influenza hospitalizations to HHS Protect. See [COVID-19 Guidance for Hospital Reporting and FAQs](#)  [680 KB, 52 pages] [↗](#) for additional details on this guidance.

## State Forecasts

State-level forecasts show the predicted number of new laboratory confirmed influenza hospital admissions per week for this week and the next 2 weeks by state. Each state forecast figure uses a different scale due to differences in the number of new influenza hospital admissions per week between states and only forecasts included in the ensemble are shown. Plots of the state-level ensemble forecasts and the underlying data can be downloaded below.
