

SUPPLEMENTARY FIGURE. Single nucleotide polymorphism phylogenetic tree of clinical specimens and environmental samples\* that tested positive for *Legionella pneumophila* type 1 — Napa County, California, 2022

**Abbreviation:** SNP = single nucleotide polymorphism.

\* The numbers following each facility label represent the sample number corresponding to that location. The clinical isolate and both isolates collected from facility A's cooling tower have zero SNP differences among them, indicating that the sequences are genetically similar. The remaining isolates have up to 12 SNP differences within this cluster and more than 80,000 SNP differences from the cluster containing the clinical isolate.
