

# Prevalence of Diagnosed Diabetes and Availability of High Speed Internet by Health Service Area

The State Average Prevalence of Diagnosed Diabetes is 9%

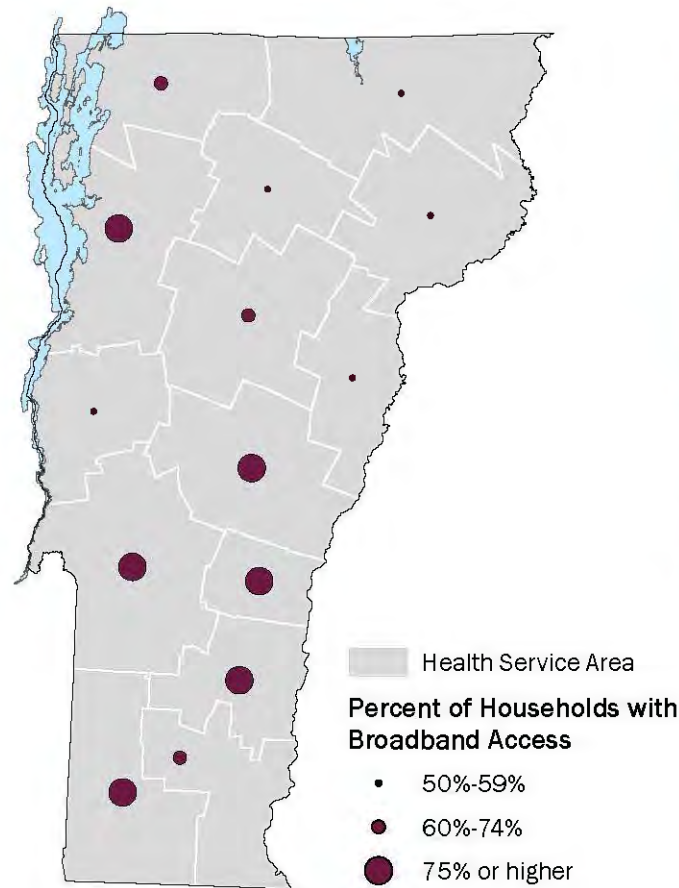

9 of 14 health service areas had a diagnosed diabetes prevalence **above** the state average.

Data Source: VT Behavioral Risk Factor Surveillance System (BRFSS), 2018-2019; Vermont Department of Public Service, 2019.

Notes: Federal Communications Commission standard for broadband is 25 Megabytes per second (Mbps) download and 3 Mbps upload (25/3). Anything slower than 25/3 is therefore considered underserved. Broadband access is presented by households not individuals with access.

Households with Broadband Access

High Prevalence Areas with Greater Household Broadband Accessibility

5 Health Service Areas had above state average prevalence of diagnosed diabetes and 60% or more of households with access to high speed internet.
