Respiratory Virus Data Channel Weekly Snapshot

Provides a summary of the key viral respiratory illness findings for COVID-19, influenza, and RSV from the past week and access to additional information and figures.

Note: data summaries are based on CDC subject matter expert interpretation of publicly available findings across multiple data systems, some of which are not included in the data visualizations on these web pages.

The amount of respiratory illness (fever plus cough or sore throat) causing people to seek healthcare is **elevated or increasing** across most areas of the country. This week, 39 jurisdictions experienced high or very high activity.

Reported on Friday, January 5th, 2024.

Summary

Seasonal influenza activity is elevated and increasing in most parts of the country. COVID-19 activity remains elevated overall and is increasing in many areas. The U.S. continues to experience elevated RSV activity, particularly among young children. Hospital bed occupancy for all patients, including within intensive care units, remains stable nationally.

Influenza

Multiple indicators of influenza activity including test positivity, emergency department visits, and hospitalizations are elevated. Influenza A(H1N1) is the predominant influenza virus circulating although influenza A(H3N2) and influenza B viruses are also being reported. Additional information about the recent increases in influenza activity can be found at: [Weekly U.S. Influenza Surveillance Report | CDC](#).

COVID-19

Test positivity (percentage of tests conducted that were positive), emergency department visits, and hospitalizations remain elevated nationally. Emergency department visits for COVID-19 are highest among infants and older adults but are also elevated for young children. JN.1 is predicted to be the [predominant SARS-CoV-2 lineage](#) nationally for the biweekly period ending January 6. CDC continues to [monitor](#) JN.1 and all other lineages. Despite the high levels of infection measured using [wastewater viral activity](#) and test positivity data, at this time, COVID-19 infections are causing severe disease less frequently than earlier in the pandemic.

RSV

RSV activity remains elevated in many areas of the country, though decreases have been observed in some areas. Hospitalization rates remain elevated, particularly among young children and older adults.

Vaccination

National vaccination coverage for COVID-19, influenza, and RSV vaccines [remains low for children and adults](#). Vaccines are available and [can help protect people](#) from the most serious health effects of fall and winter viruses.

Explore deeper data

Wastewater

Wastewater (sewage) data specific to SARS-CoV-2, the virus that causes COVID-19, are displayed at the national, regional, and state levels. These data can provide an early signal of changes in infection levels.

Nursing Homes

Data on COVID-19 cases and deaths among residents and staff of nursing homes are displayed at the national and state levels.

Forward Outlook

Estimated trends for COVID-19 and influenza infections and hospitalizations, based on modeling and forecasting, are displayed at the national and state levels.
