

# National Enteric Disease Surveillance: Shiga toxin-producing *Escherichia coli* (STEC) Annual Report, 2013

The Laboratory-based Enteric Disease Surveillance (LEDS) system contributes to the understanding of human Shiga toxin-producing *Escherichia coli* (STEC) infections in the United States by collecting reports of laboratory-confirmed infections submitted by state public health laboratories. Reporting to LEDS is voluntary; the number of states submitting reports varies somewhat from year to year, although almost all states report every year.

Data in this report are current as of February 2, 2016.

An overview of surveillance methods and systems for Shiga toxin-producing *Escherichia coli* (STEC) infections is available at <http://www.cdc.gov/ncecid/dfwed/PDFs/national-stec-surveillance-overview-508c.pdf> (1).

## Summary

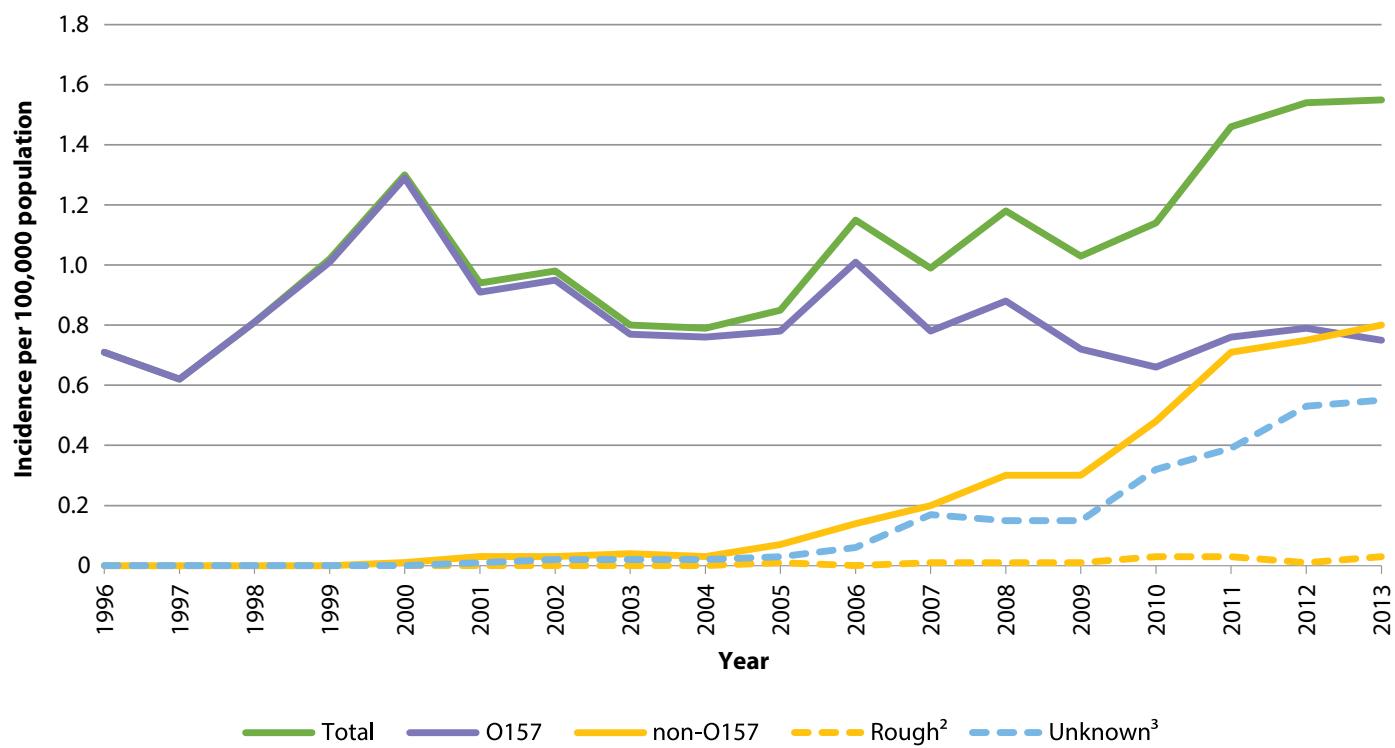

- In 2013, 51 jurisdictions (50 states plus the District of Columbia) reported 4,909 cases of culture-confirmed Shiga toxin-producing *Escherichia coli* (STEC) infections to LEDS, 2% more than in 2012.
- While incidence of serogroup O157 infection continued to decline (0.75 cases per 100,000 population in 2013), overall national incidence of culture-confirmed STEC continued to increase (1.55 cases per 100,000 population in 2013) and was 50% greater than in 2009 (1.03 cases per 100,000 population), the last year a decrease in incidence was reported. Increased overall national incidence appears to be driven by increased incidence of non-O157 serogroups (0.80 cases per 100,000 population in 2013).
- An additional 1,731 STEC infections of unknown serogroup (0.55 cases per 100,000 population) were reported.<sup>1</sup> This is a 4% increase since 2012, continuing the trend of increasing incidence started in 2004.
- Children aged 1–4 years had the highest incidence of infection of all age groups for both O157 and non-O157 serogroups.
- Infants (<1 year of age) had the largest difference in incidence between O157 and non-O157 serogroups of all age groups (0.78 vs. 2.29 for girls and 0.74 vs. 2.13 for boys).
- Incidence was highest in the North.
- The largest percentages of both O157 and non-O157 serogroups were reported in the summer months.

<sup>1</sup>The practice of testing diarrheal stools for Shiga toxin without concomitant bacterial culture and serotyping has increased in recent years (2). The LEDS system is unable to differentiate reports of culture-confirmed STEC infection of unknown serogroup from reports of STEC diagnosed only by non-culture methods.

**Figure 1.** Incidence rate of human Shiga toxin-producing *Escherichia coli* (STEC) infection reported to CDC, by serogroup and year, United States, 1996–2013<sup>1</sup>

<sup>1</sup>The “Total” category includes culture-confirmed infections of serogroup O157, non-O157 serogroups, and rough isolates.

<sup>2</sup>When isolates are rough, the O group is not expressed and cannot be determined by phenotypic methods. These isolates can be O157 or non-O157.

<sup>3</sup>The “Unknown” category includes cases diagnosed by culture-based methods where an isolate was never serogrouped and may also include cases diagnosed by culture-independent diagnostic tests (CIDTs).

**Table 1a.** Culture-confirmed human STEC infections reported to CDC, with the 10 most frequently reported serogroups listed individually, United States, 2013

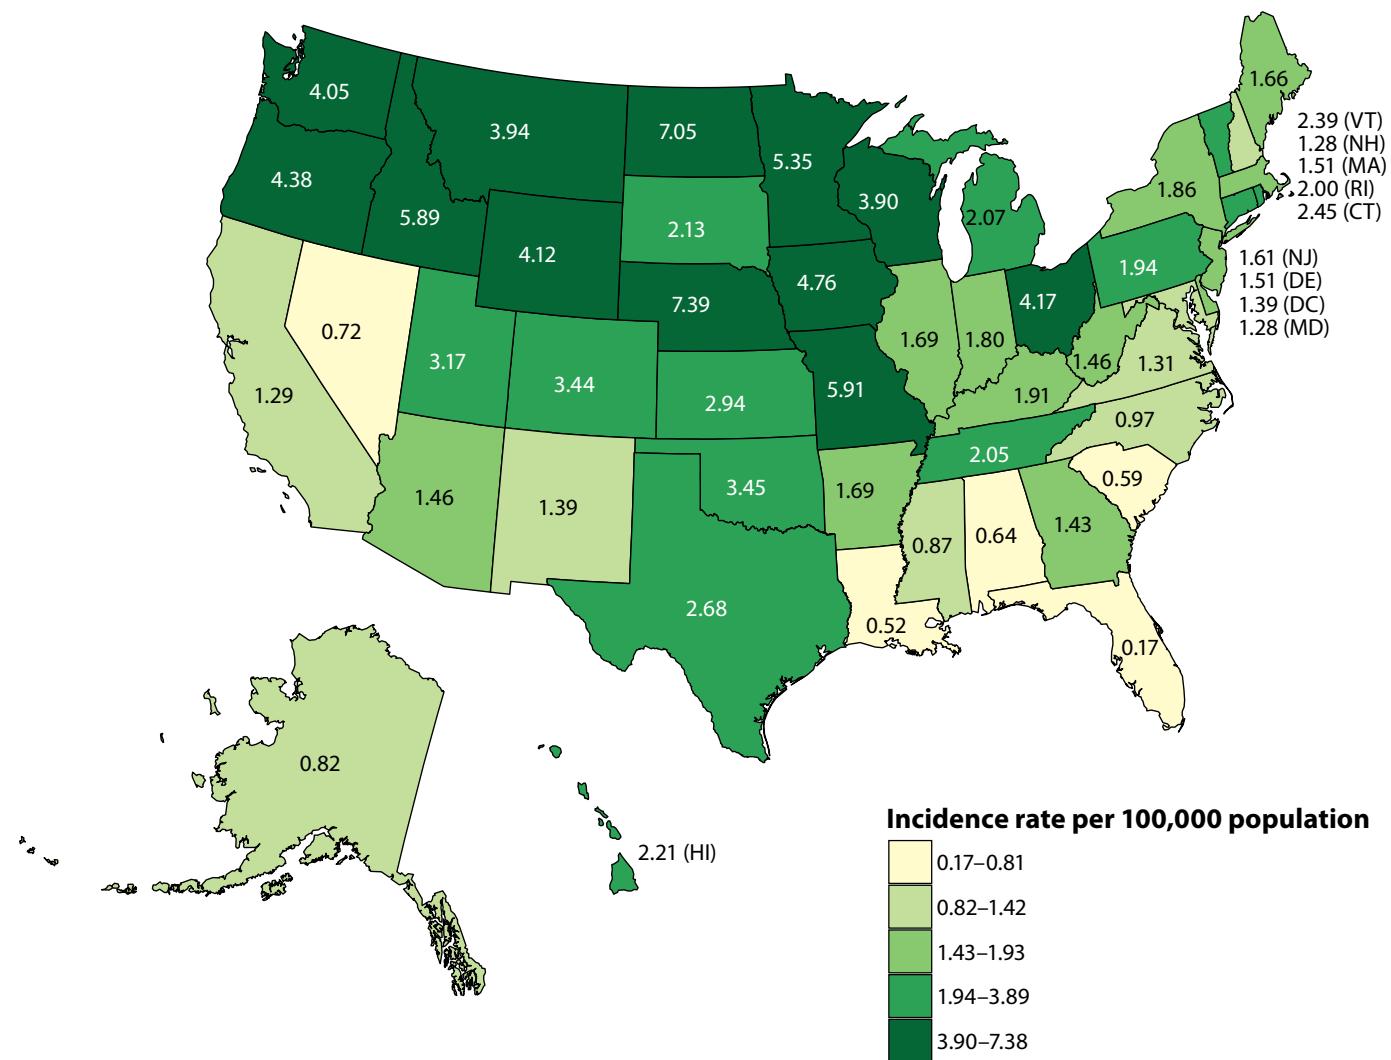

Rank	Serotype	Number reported	Percent	Incidence
1	O157	2,382	48.5	0.75
2	O26	758	15.4	0.24
3	O103	645	13.1	0.20
4	O111	416	8.5	0.13
