COVID-19 Forecasts: Hospitalizations

Updated Apr. 11, 2024

Forecasted daily COVID-19 hospital admissions as of April 8, 2024

Interpretation of Forecasts of New Hospitalizations

- This week's national ensemble predicts 240 to 2,300 daily COVID-19 hospital admissions likely reported on May 6. Ensemble hospitalization estimates for the next four weeks are also available for states and territories.
- Forecasts and recent hospitalization data for Arkansas, New Mexico, and Texas should be interpreted with caution until technical data issues can be investigated and resolved.
- Ensemble forecasts combine diverse independent team forecasts into one forecast. While they have been among the most reliable forecasts in performance over time, even the ensemble forecasts have not reliably predicted rapid changes in the trends of reported cases, hospitalizations, and deaths. They should not be relied upon for making decisions about the possibility or timing of rapid changes in trends.

National Forecasts

[Download full-sized image](#)

- The figure shows the number of daily COVID-19 hospital admissions reported in the United States each day from January 30 through March 29 and forecasted daily COVID-19 hospital admissions over the next four weeks, through May 6.
- This week, ensemble forecasts of daily COVID-19 hospital admissions included forecasts from 11 modeling groups, each of which contributed a forecast for at least one jurisdiction.
- Models make various assumptions about the levels of social distancing and other interventions, which may not reflect recent changes in behavior. See model descriptions below for details on the assumptions and methods used to produce the forecasts.

State Forecasts

State-level forecasts show the predicted number of daily COVID-19 hospital admissions for the next four weeks by state. Each state forecast figure uses a different scale due to differences in the number of daily COVID-19 hospital admissions between states and only forecasts meeting a set of ensemble inclusion criteria are shown. Further details are available here: <https://covid19forecasthub.org/doc/ensemble/> . Plots of the state-level ensemble forecasts and the underlying data can be downloaded below.

Additional forecast data and information about submitting forecasts are available at the [COVID-19 Forecast Hub](#).

Forecast Inclusion, Evaluation, and Assumptions

The teams with forecasts included in the ensembles are displayed below. Forecasts are included when they meet a set of submission and data quality requirements, further described at the [COVID-19 Forecast Hub](#).

Ensemble and individual team forecast performance is evaluated using a variety of metrics, including the assessment of prediction interval coverage, available at <https://delphi.cmu.edu/forecast-eval/>.

Reported hospitalizations can vary due to variable staffing and inconsistent reporting patterns within the week. Thus, daily variations in the reported values and the forecasts may not fully represent the true number of hospitalizations in each jurisdiction on a specific day.

Contributing Teams
