2020 National and State HAI Pro Report

Long-Term Acute Care Hospitals

Introduction: Welcome to the 2020 National and State HAI Progress Report using the 2015 baseline and risk adjustment calculations. Standardiz are used to describe different HAI types by comparing the number of observed infections to the number of predicted infections. The This report is created by CDC staff within the National Healthcare Safety Network (NHSN).

This workbook includes national and state-specific SIR data for long-term acute care hospitals (LTACHs).

Scope of report:

HAI Type	LTACH	
	National	State
Central line-associated bloodstream infections (CLABSI) by locations	þ	þ
Catheter-associated urinary tract infections (CAUTI) by locations	þ	þ
Ventilator-associated events (VAE) by locations	þ	þ
Hospital-onset methicillin-resistant *Staphylococcus aureus* (MRSA) bacteremia by facility-wide reporting	þ	þ
Hospital-onset *Clostridioides difficile* (CDI) by facility-wide reporting	þ	þ

›gress

ɀed infection ratios (SIRs)
2020 SIRs are compared to previous year's SIRs.

2020 Annual National and State HAI Progress Report
Long-term Acute Care Hospitals: Full series of tables for all national and state-specific data

NOTE: Tables contain data from Long-term Acute Care Hospitals (LTACHs); as such, they exclude

are Hospitals (LTACHs):

hospital-onset CDI between 2019 and 2020 from LTACHs

E) negative binomial regression models from LTACHs

regression models from LTACHs

data from Inpatient Rehabilitation Facilities (IRFs), Critical Access Hospitals (CAHs), and Acute Care Hospitals (AC

:Hs).

HAI and Patient Population	Reporting Hospitals			Standardize	
	No. of Long Term Acute Care Hospitals Reporting[1]	Total Patient Days	Total Device Days	Observed Events	Predicted Events
CLABSI, all[4]	406	4,686,741	1,828,129	1,583	2,237.740
ICUs[5]	72	269,032	123,649	208	280.740
Wards[6]	401	4,417,709	1,704,480	1,375	1,957.000
CAUTI, all[7]	407	4,668,375	1,511,468	1,900	2,573.760
	72	267,967	107,960	142	250.080
	402	4,400,408	1,403,508	1,758	2,323.680
VAE, all[7]	191	2,081,057	613,437	569	1,038.075
	42	117,175	61,572	127	156.984
	186	1,963,882	551,865	442	881.091

1. The number of reporting facilities included in the SIR calculation.
2. Percent of facilities with at least one predicted infection (event) that had an SIR significantly greater than or less than the nominal value of the natio
3. Facility-specific percentiles are only calculated if at least 20 facilities had ≥1.0 predicted HAI in 2020. If a facility's predicted number of HAIs was <
4. Data from all ICUs and wards
5. Data from all ICUs; excludes wards. For VAE, pediatric locations are excluded from SIR since pediatric and neonatal locations are excluded from
6. Data from all wards. For VAE, pediatric locations are excluded from SIR since pediatric and neonatal locations are excluded from VAE surveillanc
7. Data from all ICUs and wards. For VAE, pediatric locations are excluded from SIR since pediatric and neonatal locations are excluded from VAE s
   IVAC-plus includes those events identified as infection-related ventilator-associated condition (IVAC) and possible ventilator-associated pneumoni

NOTE: Risk factors used in the calculation of the number of predicted device-associated infections are listed in Appendix A.

Table 1a. National standardized infection ratios (SIRs) and facility-specific summary SIRs using HAI data reported to NHSN during 2020 by

1. Includes data reported from all locations (i.e., adult and pediatric critical care units and wards) within LTACHs.
2. Yes indicates the presence of a state mandate to report CLABSI data from any location to NHSN at the beginnir No indicates that a state mandate did not exist during 2020.
3. Yes indicates that the state health department reported the completion of all of the following validation activities: assessment of missing or implausible values on at least six months of 2020 NHSN data prior to June 1, 2021, a YesA indicates that the state also conducted an audit of facility medical or laboratory records prior to June 1, 20 varies by state). Information on validation efforts was requested from all states, regardless of the presence of a reporting of a given HAI to the state health department have performed validation on NHSN data that is voluntar
4. The number of LTACHs that reported 2020 CLABSI data and are included in the SIR calculation. SIRs and acc from at least one location in 2020.
5. Percent of facilities with ≥1.0 predicted CLABSI that had an SIR significantly greater or less than the nominal va ≥ 1.0 predicted CLABSI in 2020.
6. Facility-specific key percentiles were only calculated if at least 20 facilities had ≥1.0 predicted CLABSI in 2020. nor included in the distribution of facility-specific SIRs.

1. Includes data reported from all locations (i.e., adult and pediatric critical care units and wards) within LTACHs.
2. Yes indicates the presence of a state mandate to report CDI data from any location to NHSN at the beginning of
   No indicates that a state mandate did not exist during 2020.
3. Yes indicates that the state health department reported the completion of all of the following validation activities:
   assessment of missing or implausible values on at least six months of 2020 NHSN data prior to June 1, 2021, a
   YesA indicates that the state also conducted an audit of facility medical or laboratory records prior to June 1, 20
   varies by state). Information on validation efforts was requested from all states, regardless of the presence of a
   reporting of a given HAI to the state health department have performed validation on NHSN data that is voluntar
4. The number of LTACHs that reported 2020 CDI data and are included in the SIR calculation. SIRs and accomp
   from at least one location in 2020.
5. Percent of facilities with ≥1.0 predicted CDI that had an SIR significantly greater or less than the nominal value o
   ≥ 1.0 predicted CDI in 2020.
6. Facility-specific key percentiles were only calculated if at least 20 facilities had ≥1.0 predicted CDI in 2020. If a f
   nor included in the distribution of facility-specific SIRs.

* Statistically significant, p < 0.0500. Statistical significance based on two-tailed p-value < 0.05, reflected in the relative percent change in magnitude.

1. Data from all ICUs and wards (and other non-critical care locations).

2. States without SIR either in 2019 and/or 2020 and therefore subsequent data not calculated.

3.For states with <100% or >100% value in the percent change field, the p-value cannot be estimated due to sparse data reported within the facility type. The p-value is indicated as inestimable when the denominator of percent change (2019 SIR) = 0.

Appendix A. Factors used in NHSN risk adjustment of the device-associated HAIs (CLABSI, CAUTI, VAE) negative binomial regression models[1] from Long-Term Acute Care Hospitals

HAI Type	Validated Parameters for Risk Model
CLABSI	Intercept Location Type Facility Bed Size* Average Length of Stay**
CAUTI	Intercept Average Length of Stay** Setting† Location Type
VAE	Intercept Facility bed size* Proportion of admissions on hemodialysis*** Location Type Average Length of Stay**

1. SIR Guide: https://www.cdc.gov/nhsn/pdfs/ps-analysis-resources/nhsn-sir-guide.pdf

* Facility bed size is taken from the Annual LTACH Survey.

** Average length of stay is taken from the Annual LTACH Survey. It is calculated as: total # of annual patient da

*** Proportion of annual admissions on a ventilator (or hemodialysis) is taken from the Annual LTACH Survey. It is calculated as: number of admissions on a ventilator (or hemodialysis) / total # of annual admissions.

† LTACH Setting (free-standing vs. within a hospital) is taken from the Annual LTACH Survey.

ays / total # of annual admissions.

Appendix B. Factors used in NHSN risk adjustment of the MRSA Bacteremia and *C. difficile* negative binomial regression models[1] from Long-Term Acute Care Hospitals

HAI Type	Validated Parameters for Risk Model
MRSA bacteremia	Intercept, Percent of admissions on ventilator*
C. difficile infections	Intercept, Inpatient CO prevalence rate** Percent of admissions on ventilator* CDI test type^ Percent of single occupancy rooms‡

* Percent of annual admissions on a ventilator is taken from the Annual LTACH Survey. It is calculate
ventilator / total # annual admissions) x 100

** Inpatient community-onset prevalence is calculated as: (# of inpatient community-onset CDI events
The prevalence rate for each quarter is used in the risk adjustment.

^ CDI test type is reported on the FacWideIN MDRO denominator form on the 3rd month of each quart

‡ Percent of beds located in single occupancy rooms is taken from the Annual LTACH Survey. It is ca
rooms / total number of beds x 100.

ed as: (# admissions on a

/ total # admissions) x 100.

ter.
alculated as: # of single occupancy
