# Measles Cases and Outbreaks

Updated on April 19, 2024. CDC updates this page weekly on Fridays.

# Measles cases in 2024

As of April 18, 2024, a total of 125 measles cases were reported by 18 jurisdictions: Arizona, California, Florida, Georgia, Illinois, Indiana, Louisiana, Maryland, Michigan, Minnesota, Missouri, New Jersey, New York City, New York State, Ohio, Pennsylvania, Virginia, and Washington.

There have been 7 outbreaks (defined as 3 or more related cases) reported in 2024, and 69% of cases (86 of 125) are outbreak-associated. For comparison, 4 outbreaks were reported during 2023 and 48% of cases (28 of 58) were outbreak-associated. For more information on the ongoing outbreak in Chicago, Illinois see the Chicago Department of Public Health Measles Update .

# U.S. Cases in 2024

Total cases

125

<u>Age</u>

Under 5 years: **57 (46%)** 5-19 years: **28 (22%)** 20+ years: **40 (32%)** 

### **Vaccination Status**

Unvaccinated or Unknown: 83%

One MMR dose: **13%** Two MMR doses: **5%** 

# U.S. Hospitalizations in 2024

# 54%

of cases hospitalized (68 of 125 cases) for isolation or for management of measles complications.

### Percent of Age Group Hospitalized

Under 5 years: **65%** (37 of 57) 5-19 years: **36%** (10 of 28) 20+ years: **53%** (21 of 40)

# What to Know

## How do I protect myself?

Measles is an airborne, extremely infectious, and potentially severe rash illness. Before the measles vaccine was introduced, an estimated 48,000 people were hospitalized and 400—500 people died in the U.S. each year. Learn more.

Measles is not a seasonal virus. However, measles is often spread over times of high travel (ex: spring break) or in situations where unvaccinated persons are in close quarters (ex: summer camp).

Prevent measles and talk to your healthcare provider about the measles, mumps, and rubella (MMR) vaccine, especially if planning to travel.

More information on the vaccine for measles.

# Why is there more measles activity?

Measles was declared eliminated in the U.S. in 2000, thanks to a very high percentage of people receiving the safe and effective measles-mumps-rubella (MMR) vaccine. In recent years, however:

- U.S. MMR coverage among kindergarteners is now below the 95% coverage target—much lower in some communities—and is decreasing.
- Global measles activity is increasing, meaning more chances of an unvaccinated person infected with measles abroad returning to the U.S.

## Can I get measles while traveling?

Did you know that measles can be found around the world? Measles can live in the air for 2 hours after an infectious person leaves the space. Before any international travel, evaluate if your family needs early vaccine doses.

After you return, watch your health for 3 weeks and call your healthcare provider if you or your child gets sick with a rash and fever.

# Why are some fully vaccinated people getting measles?

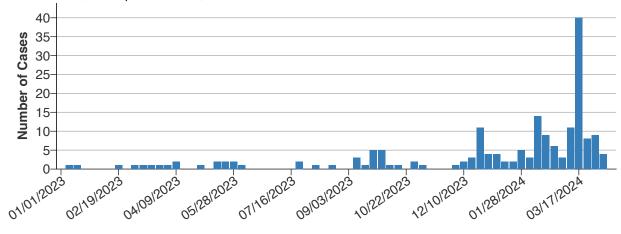

Two doses of MMR vaccine are 97% effective at preventing measles, 1 dose is 93% effective. It is uncommon for someone fully vaccinated to develop measles. However, breakthrough infections (when someone becomes infected after they have been vaccinated) can occur, especially in communities experiencing an outbreak where high levels of measles virus are circulating. The number of breakthrough infections (approximately 5% of total) is consistent with what we have seen in previous years.

# How does CDC assess measles outbreak ✓ risk?

Read more about how CDC is assessing measles outbreak risk in the U.S.

# **History of Measles Cases**

Measles was officially eliminated from the United States in 2000, meaning there is no measles spreading within the country and new cases are only found when someone contracts measles abroad and returns to the country. Achieving measles elimination status in the U.S. was a historic public health achievement. The below figure illustrates how common measles was before vaccines and how vaccine policy enabled elimination.

<sup>\*2023</sup> data are preliminary and subject to change.

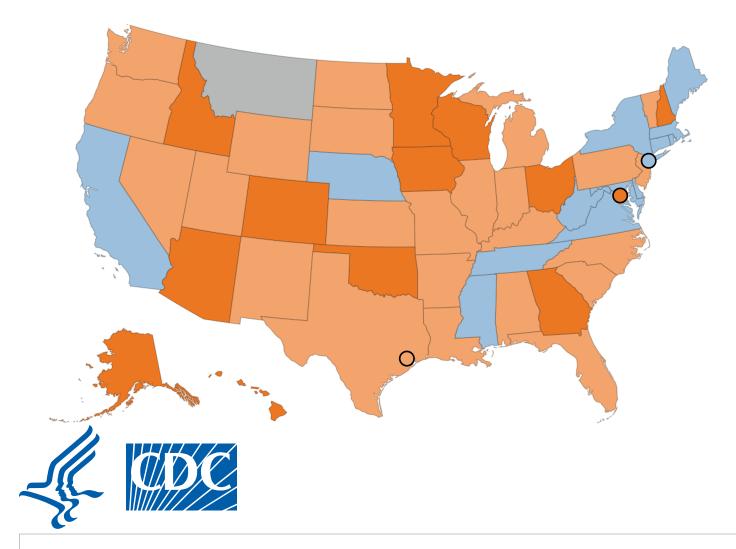

†Elimination is defined as the absence of endemic measles transmission in a region for ≥ 12 months in the presence of a well-performing surveillance system.

# MMR Vaccine Coverage for Kindergarteners by School Year (2009-2023)

The Measles, Mumps, Rubella (MMR) vaccine is very safe and effective. When more than 95% of people in a community are vaccinated (coverage >95%), most people are protected through community immunity (herd immunity). However, vaccination coverage among U.S. kindergartners has decreased from 95.2% during the 2019–2020 school year to 93.1% in the 2022–2023 school year, leaving approximately 250,000 kindergartners at risk each year over the last three years. To dive into vaccine coverage data for MMR, visit VaxView | CDC.

At local levels, vaccine coverage rates may vary considerably, and pockets of unvaccinated people can exist in states with high vaccination coverage. When measles gets into communities of unvaccinated people in the U.S., outbreaks can occur.

**2023** 2022 2021 2020 2019 2018 2017 2016 2015 2014 2013

### Measles cases in 2023

During January 1-December 31, 2023, a total of 58 measles cases were reported by 20 jurisdictions: California, Colorado, District of Columbia, Florida, Hawaii, Idaho, Illinois, Kentucky, Maryland, Missouri, New Jersey, New York City, Ohio, Oregon, Pennsylvania, Texas, Utah, Virginia, Washington, and Wisconsin.

### Measles cases in 2022

From January 1 to December 31, 2022, a total of 121 measles cases were reported by 6 jurisdictions. \*

For more information please see the following reports:

Notes from the Field: Measles Outbreak — Central Ohio, 2022–2023
 MMWR. August 4, 2023

## Measles cases in 2021

From January 1 to December 31, 2021, a total of 49 measles cases were reported by 5 jurisdictions. \*

For more information please see the following reports:

 Public Health Actions to Control Measles Among Afghan Evacuees During Operation Allies Welcome — United States, September-November 2021
 MMWR. April 29, 2022

## Measles cases in 2020

From January 1 to December 31, 2020, 13 individual cases of measles were confirmed in 8 jurisdictions.\*

### Measles cases in 2019

From January 1 to December 31, 2019, 1,274 individual cases of measles were confirmed in 31 states.

This is the greatest number of cases reported in the U.S. since 1992. The majority of cases were among people who were not vaccinated against measles. Measles is more likely to spread and cause outbreaks in U.S. communities where groups of people are unvaccinated.
