

## APPENDIX

### **Exhibit 1. Methods.**

In 2015, the GPHAC was formed under the auspices of the Roundtable on Genomics and Precision Health at the National Academies of Sciences, Engineering, and Medicine. The authors of this paper are participants in the GPHAC Cascade Screening sub-group, which aims to identify and develop best practices for identifying and testing at-risk relatives of those diagnosed with familial hypercholesterolemia (FH), Lynch syndrome (LS), and/or hereditary breast and ovarian cancer (HBOC).<sup>(1)</sup> This work reflects the efforts of this GPHAC sub-group. We identified a need to summarize the current literature and state-level policies related to cascade screening.

**Data sources and searches.** We performed a scoping review of the current US and non-US literature on cascade screening for genetic disorders. We searched Medline, Embase, Global Health, PsycInfo, CINAHL, and Scopus databases for literature on five subtopics related to cascade screening: barriers/facilitators, cost effectiveness, implementation, national health systems/registries, and policy interventions. Specific search strategies for each database can be found in Appendix Exhibit 2 (table). We identified and removed duplicate articles using EndNote (n=600, Appendix Exhibit 3 (figure)).

**Study selection.** We restricted our search to human studies published from January 1, 1990 to August 1, 2017. During title and abstract review, we excluded literature that was not written in English, conference and meeting abstracts, non-research studies (e.g., commentaries, editorials, literature reviews), epidemiological and molecular studies describing genetic risk factors of disease, and studies that examined genetic testing of probands only (Appendix Exhibit 4 (table)). While literature reviews were not included in our review, we reviewed their reference lists and included relevant articles.

**Data extraction and synthesis.** During full-text review, additional articles were excluded that did not meet our inclusion criteria. We coded included articles using the PICOTS framework(2, 3), which includes abstracting information on each study's population, intervention (if applicable), comparison group (if applicable), outcomes, timing, and setting (Appendix Exhibit 5 (table)). Multiple coders reviewed and abstracted articles, and 20% of included articles were double coded to ensure consistency across coders. When inconsistencies in coding were identified, a third author adjudicated the discrepancy (coding agreement= 86.4%). Given the significant heterogeneity among populations, study designs, outcomes, timing and settings, we did not conduct meta-analyses. We summarized the literature using the following key questions: What interventions have been tested and found effective? What are the barriers and facilitators to cascade screening? What are the considerations when aligning intervention approaches with state and federal privacy policy? Where do we need additional research?

**State policy search.** In a separate search, we examined laws across the 50 states and the District of Columbia, about laws regulating collection, use and release of genetic information that could affect implementation of some cascade screening approaches.(4, 5) Smith et al. completed a survey of genetic privacy laws across all 50 states which formed the basis for this policy search.(5) We confirmed the effective dates of the laws cited in Smith et al. to determine whether they were still current and relevant to our work. To this end, we conducted a search of the Westlaw database for state statutes and regulations related to health information privacy, genetic testing and genetic privacy, and reportable diseases. We determined when each law cited in Smith et al. was last amended. We found that 77 of the laws had been amended between January 1, 2011 and October 26, 2017, and we included the amended language in our

review. We excluded 224 laws that did not pertain to the disclosure of protected genetic health information. The remaining 46 laws were qualitatively described.

**Appendix Exhibit 2.** Search strategies employed for each database.

A scoping literature search was systematically conducted to find the literature related to cascade screening and the following areas:

- National health systems
- Barriers and facilitators
- Implementation
- Policy
- Cost effectiveness

We implemented targeted search strategies for each database and topic area (i.e., Medline, Embase, Global Health, PsycInfo, CINHAL, and Scopus. See specific search strategies for each key area below.

Limits: Humans, English, 1990-present

**NATIONAL HEALTH SYSTEMS Search Strategy:**

Database	Strategy	Run Date	Records
