Influenza A Virus Wastewater Data

Updated May 14, 2024

Main Findings from Wastewater Surveillance

- During the two most recent weeks (April 21-May 4), a total of 230 of 674 sites in 34 states reported data meeting criteria for analysis for influenza virus A in both weeks or either week, and 3 (1%) sites from three states were at the high level ($\geq 80^{\text{th}}$ percentile compared to levels recorded at that site between October 1, 2023 and March 2, 2024).

Wastewater and the Current Outbreak of Influenza A (H5N1) in birds, cattle, and other animals:

- Current wastewater monitoring methods detect influenza A viruses but do not determine the subtype. This means that avian influenza A(H5N1) viruses can be detected but would not be distinguished from other influenza A virus subtypes.
- Wastewater testing cannot determine the source of the influenza A virus. It could come from a human or from an animal (like a bird) or an animal product (like milk from an infected cow).
- Public health officials at CDC and state and local health departments are monitoring these data. For areas where influenza A virus levels in wastewater are high, CDC works with relevant partners to better understand the factors that could be contributing to these levels.
- Efforts to monitor influenza A virus activity using wastewater data are likely to evolve as the methodologies and interpretation are evaluated and refined.
- For the latest information on H5N1, and what you can do to protect yourself, visit [H5N1 Bird Flu: Current Situation](#). For the latest information on influenza activity in people, visit the [Weekly U.S. Influenza Surveillance Report](#).

Number of Wastewater Sites with Data Meeting Criteria for Analysis Reporting Current High Influenza A Levels in Recent Two Weeks: 3 (1% of Total Sites)

Number of Sites with Data Meeting Criteria for Analysis Reporting Influenza A Wastewater Data in Past Two Weeks: 230

Influenza A in Wastewater – Site Level

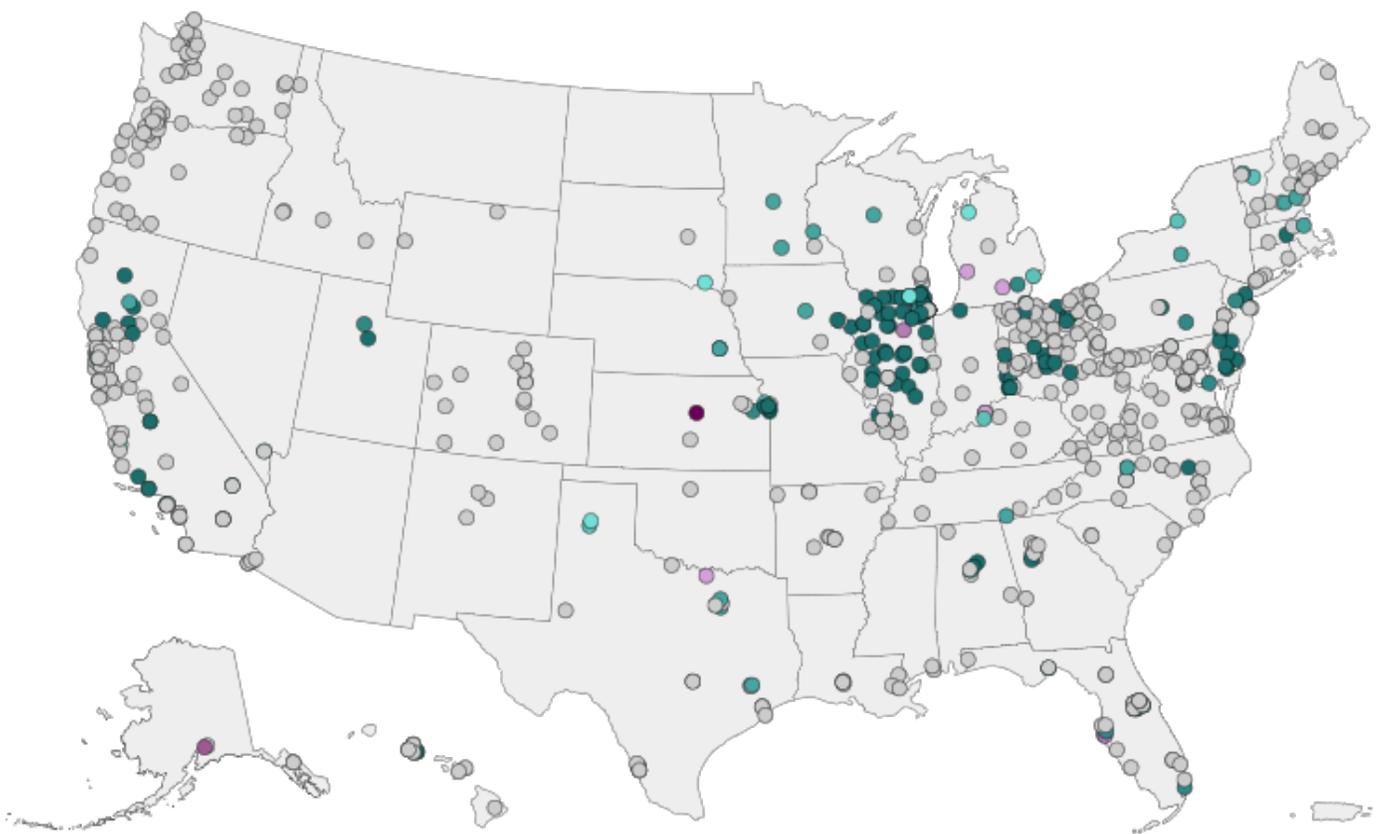

This interactive map shows current site-level data for influenza A virus in wastewater. Each dot on the map represents a wastewater sampling site. Sites are categorized based on the current level of influenza A compared to the past levels at the same site during the 2023-2024 influenza season. When influenza A virus levels are at the 80th percentile or higher, CDC will work with relevant partners to better understand the factors that could be contributing to these levels.

Wastewater data for influenza A is available for the most recent two weeks:

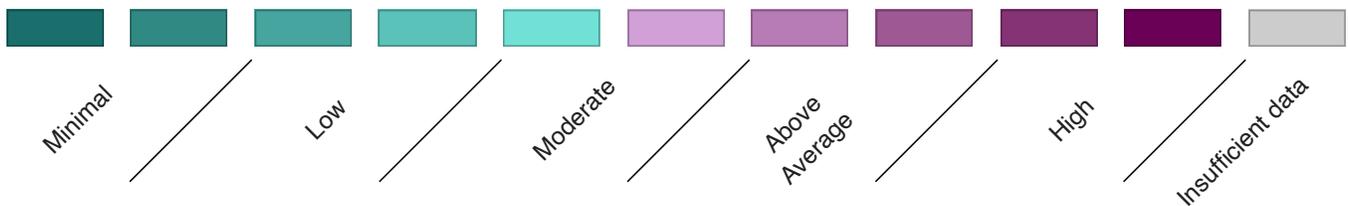

- April 21, 2024 – April 27, 2024
- April 28, 2024 – May 4, 2024

Week

2024-05-04

Select a color from the legend to add or remove it from the map.

All data are preliminary and may change as more reports are received. Wastewater data does not distinguish between human and animal waste or by-products.

About the Data:

The influenza A virus level metric describes how current influenza A virus wastewater levels at a site compare to past levels at the same site during the 2023-2024 influenza season, October 1, 2023 to March 2, 2024. This metric is represented both categorically and as a percentile.

The percentile represents the position of the current level within the historical range. A value of 0 indicates that the current level is the lowest recorded at the site, while a value of 100 indicates that it is the highest.

The wastewater level for influenza A is categorized as follows:

- **Minimal** = The site's current level for influenza A virus is **minimal** compared to the data collected from the last influenza season. The current level is within the lowest 0-<20th percentile of influenza A virus recorded at that site or influenza A virus was not detected in the most recent sample.
- **Low** = The site's current level for influenza A virus is **low** compared to data collected from the last influenza season. Its current level is within the 20-<40th percentile of influenza A virus recorded at that site.
- **Moderate** = The site's current level for influenza A virus is **moderate** compared to data collected from the last influenza season. Its current level is within the 40-<60th percentile of influenza A virus recorded at that site.
- **Above Average** = The site's current level for influenza A virus is **above average** compared to data collected from the last influenza season. Its current level is within the 60-<80th percentile of influenza A virus recorded at that site.
- **High** = The site's level activity for influenza A virus is **high** compared to data collected from the last influenza season. Its current level is at 80th percentile or higher for influenza A virus recorded at that site.
- **Insufficient Data** = Site is testing for influenza A but does not have sufficient data for a comparison with the 2023-2024 influenza season or a site that has not submitted data in the last two weeks.

Wastewater sampling sites can encompass populations of varying sizes (also known as a sewershed population) that may extend across county or state boundaries.

What CDC is Doing with Influenza A Wastewater Data: Wastewater surveillance complements other [existing influenza virus surveillance systems](#) to monitor influenza trends. Sites with high levels of influenza A virus (80-100th percentile) detected in wastewater are being closely monitored by CDC and its partners to identify potential contributing factors. This involves analyzing routine influenza virus and syndromic surveillance data to understand human influenza A infections and following up with the relevant jurisdiction to better understand the factors that could be contributing to these levels. Additionally, this could include reviewing other potential contributors of virus into wastewater. For instance, some states have identified non-human sources such as milk processing waste that contribute to wastewater sites.

Wastewater surveillance is an evolving science. Efforts to monitor influenza A virus activity using wastewater data are likely to evolve as the methodologies and interpretation are evaluated and refined.

Data Limitations:

- Current wastewater monitoring methods detect influenza A viruses but do not distinguish the subtype. This means that avian influenza A(H5N1) viruses can be detected but would not be distinguished from other influenza A virus subtypes.
- Wastewater testing cannot determine the source of the influenza A virus. It could come from a human or from an animal (like a bird) or an animal product (like milk from an infected cow).

Data Source: [CDC's National Wastewater Surveillance System \(NWSS\)](#) has over 600 sites from a variety of partners reporting influenza A virus data to CDC.
