

HIV | SURVEILLANCE DATA TABLES

**Core Indicators for Monitoring the
Ending the HIV Epidemic Initiative:
National HIV Surveillance System Data
Reported Through June 2024**

U.S. DEPARTMENT OF
HEALTH AND HUMAN SERVICES
CENTERS FOR DISEASE
CONTROL AND PREVENTION

This issue of *HIV Surveillance Data Tables* is published by the Division of HIV Prevention (DHP), National Center for HIV, Viral Hepatitis, STD, and TB Prevention, Centers for Disease Control and Prevention (CDC), U.S. Department of Health and Human Services, Atlanta, Georgia.

Data are presented for HIV diagnoses reported to CDC through June 2024.

HIV Surveillance Data Tables is not copyrighted and may be used and copied without permission. Citation of the source is, however, appreciated.

Acknowledgments

This issue of *HIV Surveillance Data Tables* was prepared by the following staff and contractors of the Division of HIV Prevention, National Center for HIV, Viral Hepatitis, STD, and TB Prevention, CDC: Taylor Jones, Zanetta Gant Sumner, Maya Zvavitch, Xueyuan Dong, Chan Jin, Xiaohong Hu, Jianmin Li, Stacy Cohen, and Michael Friend (editing and desktop publishing).

Publication of *HIV Surveillance Data Tables* was made possible by the contributions of the state and territorial health departments and the HIV surveillance programs that provided surveillance data to CDC.

Technical Notes

The *Ending the HIV Epidemic in the U.S.* (EHE) initiative leverages critical scientific advances in HIV prevention, diagnosis, treatment, and outbreak response [1]. The goal of the initiative is to reduce new HIV infections by 75% by 2025 and by 90% by 2030. The Centers for Disease Control and Prevention (CDC) routinely releases *HIV Surveillance Data Tables* on the core indicators for EHE to allow for more timely monitoring of progress. The full list of EHE core indicators and their definitions can be found in the Technical Notes of the *Core indicators for monitoring the Ending the HIV Epidemic initiative* report, available at <https://www.cdc.gov/hiv-data/initiatives/>.

The tables included in this report provide *preliminary* data on HIV diagnoses and linkage to HIV medical care for the years 2023 and 2024 based on cases reported to CDC as of June 2024. Data for the 2 indicators are provided at the national, state, and county levels (EHE Phase I jurisdictions only). See Tabulation and Presentation of Data for details on how the indicators are calculated. More information on HIV surveillance practices and limitations, demographic information, and geographic designations can be found in the Technical Notes of the *HIV Surveillance Report, 2022*, available at <https://www.cdc.gov/hiv-data/nhss/hiv-diagnoses-deaths-prevalence.html>.

TABULATION AND PRESENTATION OF DATA

HIV Diagnoses

HIV diagnoses are the numbers of persons aged ≥ 13 years with HIV diagnosed during January 2023 through June 2024 (Tables 1a–d). Data presented were reported (after the removal of personally identifiable information) to CDC.

An evaluation of surveillance data (2016–2020 diagnoses) found that, on average, approximately 80% of HIV diagnoses are reported to CDC during the year of diagnosis and approximately 98% of HIV diagnoses are reported to CDC by the end of the following year. Data for the years 2023 and 2024 are considered preliminary until a 12-month reporting delay has been reached and should be interpreted with caution.

More information on counting HIV diagnoses can be found in the *HIV Surveillance Report, 2022*, available at <https://www.cdc.gov/hiv-data/nhss/hiv-diagnoses-deaths-prevalence.html>.

Linkage to HIV Medical Care

Linkage to HIV medical care within 1 month of HIV diagnosis is measured for persons aged ≥ 13 years with HIV diagnosed during January 2023 through March 2024 and who resided in any of the jurisdictions (including EHE Phase I jurisdictions) with complete reporting of laboratory data to CDC at the time of diagnosis (Tables 2a–c). The numerator is the number of persons aged ≥ 13 years with HIV diagnosed during January 2023 through March 2024 and who had ≥ 1 CD4 T-lymphocyte (CD4) or viral load (VL) tests within 1 month of HIV diagnosis. The denominator is the number of persons aged ≥ 13 years with HIV diagnosed during January 2023 through March 2024. Reporting of linkage to HIV medical care data requires a minimum 3-month reporting delay to account for delays in reporting of laboratory results to the National HIV Surveillance System (NHSS); therefore, data on linkage to HIV medical care in these surveillance tables are for persons with HIV diagnosed during January 2023 through March 2024 and reported to NHSS through June 2024. Data for the years 2023

and 2024 are considered preliminary until a 12-month reporting delay has been reached and should be interpreted with caution.

Data are not provided for states and associated areas that do not have laws requiring reporting of all CD4 and viral loads, or that have incomplete reporting of laboratory data to CDC. Areas without laws: Idaho. Areas with incomplete reporting: New Jersey and Puerto Rico. Data for Mississippi and West Virginia were included in analyses but should also be interpreted with caution due to a lapse in laboratory reporting that occurred during the year 2022.

More information on calculating linkage to care can be found in the report *Monitoring selected national HIV prevention and care objectives by using HIV surveillance data—United States and 6 territories and freely associated states, 2022*, available at <https://www.cdc.gov/hiv-data/nhss/national-hiv-prevention-and-care-outcomes.html>.

Note. Data are for cases reported to CDC through June 2024. Data are considered preliminary until a 12-month reporting delay has been reached, and should be interpreted with caution.

^a “Transgender woman” includes persons who were assigned male sex at birth but have ever identified as a woman.

“Transgender man” includes persons who were assigned female sex at birth but have ever identified as a man.

^b Additional gender identity examples include “nonbinary,” “gender queer,” and “two-spirit.”

^c Hispanic/Latino persons can be of any race.

^d Transmission category is classified based on a hierarchy of the risk factors most likely responsible for HIV transmission; classification is determined based on the person’s sex assigned at birth. Because data have been imputed or statistically adjusted to account for missing transmission category, manual calculations of reported data by transmission category may be inaccurate or unreliable and are discouraged. Also, data may not be reported for some populations; therefore, values may not sum to column subtotals and total.

^e Includes persons assigned male sex at birth, regardless of current gender identity, who have had sexual contact with other males, and persons assigned male sex at birth who have had sexual contact with both males and females (i.e., bisexual contact).

^f Includes persons who injected nonprescription drugs or who injected prescription drugs for nonmedical purposes. Also includes injection of drugs prescribed to persons if there is evidence that injection equipment was shared (e.g., syringes, needles, cookers).

^g Heterosexual contact with a person known to have, or with a risk factor for, HIV.

^h Other risk factors, including hemophilia, blood transfusion, and risk factor not reported or not identified. Data not displayed because the numbers were too small to be meaningful.

ⁱ Region of residence defined by the U.S. Census Bureau. For more information, see <https://www.census.gov/programs-surveys/economic-census/guidance-geographies/levels.html>. Data are based on residence at time of HIV diagnosis.

^j Includes persons of unknown gender.

Abbreviations: CD4, CD4+ T-lymphocyte count (cells/mm³ or cells/µL) or percentage; VL, viral load (copies/mL); CDC, the Centers for Disease Control and Prevention [footnotes only].

Note. Linkage to HIV medical care was measured by documentation of ≥1 CD4 or VL tests ≤1 month after HIV diagnosis. Data are for cases reported to CDC through June 2024, are considered preliminary until a 12-month reporting delay has been reached, and should be interpreted with caution. Data are based on residence at time of HIV diagnosis. Data are not provided for states and associated jurisdictions that do not have laws requiring reporting of all CD4 and viral loads or that have incomplete reporting of laboratory data to CDC. Areas without laws: Idaho. Areas with incomplete reporting: New Jersey and Puerto Rico.

^a “Transgender woman” includes persons who were assigned male sex at birth but have ever identified as a woman. “Transgender man” includes persons who were assigned female sex at birth but have ever identified as a man.

^b Additional gender identity examples include “nonbinary,” “gender queer,” and “two-spirit.”

^c Hispanic/Latino persons can be of any race.

^d Transmission category is classified based on a hierarchy of the risk factors most likely responsible for HIV transmission; classification is determined based on the person’s sex assigned at birth. Because data have been imputed or statistically adjusted to account for missing transmission category, manual calculations of reported data by transmission category may be inaccurate or unreliable and are discouraged. Also, data may not be reported for some populations; therefore, values may not sum to column subtotals and total.

^e Includes persons assigned male sex at birth, regardless of current gender identity, who have had sexual contact with other males, and persons assigned male sex at birth who have had sexual contact with both males and females (i.e., bisexual contact).

^f Includes persons who injected nonprescription drugs or who injected prescription drugs for nonmedical purposes. Also includes injection of drugs prescribed to persons if there is evidence that injection equipment was shared (e.g., syringes, needles, cookers).

^g Heterosexual contact with a person known to have, or with a risk factor for, HIV.

^h Includes persons with other risk factors, including hemophilia, blood transfusion, and risk factor not reported or not identified. Data not displayed because the numbers were too small to be meaningful.

**Table 2b. Linkage to HIV medical care within 1 month of HIV diagnosis among persons aged ≥13 years, by area of residence, January 2023 through March 2024—

Abbreviations: CD4, CD4+ T-lymphocyte count (cells/mm³ or cells/µL) or percentage; VL, viral load (copies/mL); CDC, the Centers for Disease Control and Prevention [footnotes only].

Note. Linkage to HIV medical care was measured by documentation of ≥1 CD4 or VL tests ≤1 month after HIV diagnosis. Data are for cases reported to CDC through June 2024, are considered preliminary until a 12-month reporting delay has been reached, and should be interpreted with caution. Data are based on residence at time of HIV diagnosis. Data are not provided for states and associated jurisdictions that do not have laws requiring reporting of all CD4 and viral loads or that have incomplete reporting of laboratory data to CDC. Areas without laws: Idaho. Areas with incomplete reporting: New Jersey and Puerto Rico.

^a Data should be interpreted with caution due to a lapse in laboratory data completeness that occurred during the year 2022.
