

Mapping and Size Estimation of Key Populations Nigeria, 2018

Final Report from Six States and the Federal Capital Territory

Collaborating Institutions:

Ministry of Health, National AIDS & STI Control Program (NASCP), National Agency for the Control of AIDS (NACA), U.S. Centers for Disease Control and Prevention (CDC), University of Maryland School of Medicine, Baltimore (UMB)

Date: July 31, 2019

Funding Source: The President's Emergency Plan for AIDS Relief (PEPFAR) through the U.S. Centers for Disease Control and Prevention Cooperative Agreement (U2GGH001946)

NTT Primary Contact: Gregory Ashefor, MD, Chairman, Population Size Estimation National Technical Team (email: asheforgreg@ yahoo.co.uk)

CDC Atlanta Primary Contact: Anne McIntyre, PhD, U.S. Centers for Disease Control and Prevention, Atlanta, Georgia, USA (email: zat4@cdc.gov)

CDC Nigeria Primary Contact: Victor Sebastian, MBBS, MPH, FMCPh, U.S. Centers for Disease Control and Prevention, Abuja, Nigeria (email: wzn3@cdc.gov)

UMB Primary Contact: Manhattan Charurat, PhD, Professor, Director, Epidemiology and Prevention, Institute of Human Virology, University of Maryland School of Medicine, Baltimore, MD, USA (email: mcharurat@ihv.umaryland.edu)

The Key Population Size Estimation (KPSE) study was led by the Government of Nigeria through the Federal Ministry of Health (FMOH) and the National Agency for the Control of AIDS (NACA), and conducted with funding from the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) with technical assistance from the United States (U.S.) Centers for Disease Control and Prevention (CDC). This activity was implemented by the Key Population Size Estimation National Technical Team (NTT), led by the University of Maryland, Baltimore (UMB).

Acknowledgements

The success of this study and report was made possible by the contributions of a number of individuals and organizations. We wish to acknowledge the financial and technical support of the US-Centers for Disease Control and Prevention (CDC), particularly Dr. Anne McIntyre, as well as the CDC office in Nigeria.

We would also like to extend our sincere thanks to all of the State Technical Teams, particularly the State Agencies for the Control of AIDS (SACA) in Akwa Ibom, Benue, Cross River, Nasarawa, Lagos, Rivers, and the Federal Capital Territory (FCT) for guiding all aspects of the study from conceptualization to completion. Their visits to the field and frequent interaction with the research team proved to be extremely helpful while carrying out the study.

We also gratefully acknowledge the substantial contribution of the National Technical Team for their input throughout this study. Moreover, we are also grateful to the key population (KP)-led, community-based organizations in Nigeria for their deep involvement in the whole process.

Special appreciation goes to our enumerators and study respondents, who despite their busy lives gave their valuable time for the interviews and shared their personal experiences. Finally, we would like to thank the UMB in-country project lead Mr. Samuel Nwafor, the Principal Investigator Dr. Man Charurat, study coordinators, state managers, and the Baltimore technical core team for their effective support.

Dr. Gregory Ashefor

Chairman of the Population Size Estimation National Technical Team (NTT)

Head, Strategic Information and Knowledge Management

National Agency for the Control of HIV/AIDS

The Government of Nigeria would like to thank the following individuals who contributed to this study:

Foreword

For the first time since the discovery of HIV, we potentially have all the tools needed to end the epidemic. Reliable tests to detect the virus, durable treatment to suppress the virus among those infected and to prevent onward transmission, and proven prevention tools have tipped the scales and brought us within arm's reach of eliminating HIV in Nigeria. Results from the recently completed Nigeria HIV/AIDS Indicator and Impact Survey (NAIIS) revealed an HIV prevalence of 1.4% among men and women of reproductive age (15-49 years), much lower than was previously thought, although the country is still home to 1.9 million people living with HIV. These findings indicate that significant strides have been made towards achieving epidemic control. We also now have the evidence to confidently say that Nigeria has transitioned from a generalized to a mixed epidemic, as suggested by the disproportionate contribution of key populations (KP)—i.e., female sex workers, men who have sex with men, and people who inject drugs in driving the epidemic. This knowledge brings about a renewed focus on KP in Nigeria and, with it, the diligent use of information on where the epidemic persists, and how to reach these highly stigmatized, often hidden populations. Accounting for human behavior, heterogeneous capture probabilities, and social visibility, the empirical key population size estimates presented in this report provide critical information for tailoring appropriately scaled response efforts and policy development. The results from this study demonstrate innovative methods to bridge data gaps and inform programs that will bring us one-step closer to an HIV-free generation in Nigeria.

The success of this study would not have been possible without the support of the US Centers for Disease Control and Prevention, the University of Maryland, Baltimore, State Agencies for the Control of AIDS, and KP community-based organizations in the 6+1 states: Akwa Ibom, Benue, Cross River, Lagos, Nasarawa, Rivers, and the Federal Capital Territory. The National Agency for the Control of AIDS is pleased to share these findings and encourages the utilization of these data to guide HIV programming for KP in the 6+1 states.

A handwritten signature in black ink, appearing to read "Sani Aliyu", with a small checkmark at the end of the line.

Dr. Sani Aliyu
Director General (DG), National Agency for the Control of AIDS (NACA)

Executive Summary

Between August 2018 and January 2019, the study team conducted a formative assessment, hotspot mapping and validation exercise, and three-source capture recapture (3S-CRC) exercise as part of a key population size estimation (KPSE) activity in the PEPFAR priority states of Akwa Ibom, Benue, Cross Rivers, Lagos, Nasarawa, Rivers, and the FCT. The empirical methods for population size estimation chosen for multiple-source capture-recapture provide critical information for planning and implementing targeted HIV prevention, care and treatment programs, taking into account the mixed nature of Nigeria's epidemic in the priority states.

Across the three KP groups included in this activity, female sex workers (FSW), men who have sex with men (MSM), and people who inject drugs (PWID), a total of 1,297 KP hotspots were identified in Akwa Ibom State, 1,714 hotspots in Benue State, 2,666 KP hotspots in Cross Rivers State, 1,204 KP hotspots in FCT, 2,974 hotspots in Lagos State, 1,550 hotspots in Nasarawa State, and 2,494 hotspots in Rivers State.

With few exceptions, the majority of the enumerators were KP members. The close involvement of KP community-based organizations (CBO) allowed the study to reach previously unidentified and inaccessible hotspots. The information obtained from this study is intended to support efforts to respond to the HIV epidemic outlined in Nigeria's National Strategic Framework, particularly in moving towards location-population strategy and facilitating access to HIV prevention and treatment among members of key and vulnerable populations ^{1,2}.

Protocol Synopsis

Title	Mapping and Size Estimation of Key Populations in Nigeria
Purpose	To obtain population size estimates (PSE) for FSW, MSM, and PWID in Akwa Ibom, Benue, Cross River, Lagos, Nasarawa, and Rivers plus the Federal Capital Territory ("6+1") PEPFAR priority states of Nigeria using empirical methods.
Study Design	KP size estimates were produced using three-source capture-recapture (3S-CRC).
Study population	<ul style="list-style-type: none">• FSW were defined as any woman (female sex at birth) 15 years and above who received money or goods in exchange for sexual services, either regularly or occasionally, in the 12 months preceding this activity.• MSM were defined as any man (male sex at birth) 15 years and above who engaged in oral and/or anal (receptive or insertive) sex with another man at least once in the 12 months preceding this activity.• PWID were defined as any person 15 years and above who injected drugs (illicit, non-prescribed, and illegal) recreationally at least once in the last 12 months preceding this activity.
Study Duration	<ul style="list-style-type: none">• Formative Assessment: July 2018• Hotspot Mapping and Validation: August - November 2018• Multiple-source Capture-recapture<ul style="list-style-type: none">◦ <i>Venue-based capture:</i> October – December 2018◦ <i>Facility-based capture:</i> December 2018 – January 2019
Study Sites	The study was conducted in the 6+1 PEPFAR priority states of Akwa Ibom, Benue, Cross River, Lagos, Nasarawa, Rivers, and the FCT.
Primary Objective	<ul style="list-style-type: none">• To obtain state-level key population size estimates in the 6+1 PEPFAR priority states in Nigeria using 3S-CRC.
Secondary Objectives	<ul style="list-style-type: none">• To map and, where appropriate, characterize the type of KP hotspots in the 6+1 PEPFAR priority states.• To obtain sex and age-disaggregated PSE of PWID and age-disaggregated PSE of FSW and MSM in the 6+1 PEPFAR priority states.

1. Introduction

1.1. Background

Nigeria has an estimated 1.9 million people living with HIV (PLHIV)³. In 2017, UNAIDS models demonstrated high prevalence among Nigeria's KP: 14.4% among FSW, 23.0% among MSM, and 3.4% among PWID³. Nigeria is characterized as having a mixed HIV epidemic with a high HIV prevalence among KP, and low prevalence of 1.4% among other men and women of reproductive age³. The Government of the Federal Republic of Nigeria (GoN) National HIV and AIDS Strategic Framework 2017-2021 outlines the plan to "Fast-Track the national response towards ending AIDS in Nigeria by 2030" and includes focused interventions to increase testing and treatment for key populations^{1,2}. To guide focused and appropriately scaled HIV epidemic response efforts for KP, program and policy development requires reliable, empirical population size estimates (PSE).

Various methodologies have been used to produce KP size estimates in Nigeria, and, generally, have been limited in scope and coverage^{4,5,6}. Table 1 provides a brief summary of methods, study populations, and locations of previous PSE in Nigeria. With a broad range of non-empirical methodologies used and estimates obtained, the reliability of the results have been questioned.

Table 1: Summary of Previous Key Population Size Estimates Reported in Nigeria

No	Author and publication date (study date)	State (s)	KP group	Population size estimate	Confidence Interval (95% CI)	Methodology	Key Limitations

[†](commonly known as the University of Manitoba approach)

The empirical methods for PSE used for this exercise provide critical information for planning and implementing targeted HIV prevention, care, and treatment programs. The information obtained from this study will support efforts to respond to the epidemic as outlined in Nigeria's National Strategic Framework especially in moving towards a location-population strategy ^{2,3}.

1.2. Study Goals and Objectives

1.2.1. Primary Objective

- To obtain state-level key population size estimates in the 6+1 PEPFAR priority states in Nigeria using multiple-source capture-recapture (MS-CRC).

1.2.2. Secondary Objectives

- To map and, where appropriate, characterize the type of key population hotspots in the 6+1 PEPFAR priority states.
- To obtain sex- and age-disaggregated population size estimates of people who inject drugs and age-disaggregated population size estimates of female sex workers and men who have sex with men in the 6+1 PEPFAR priority states.

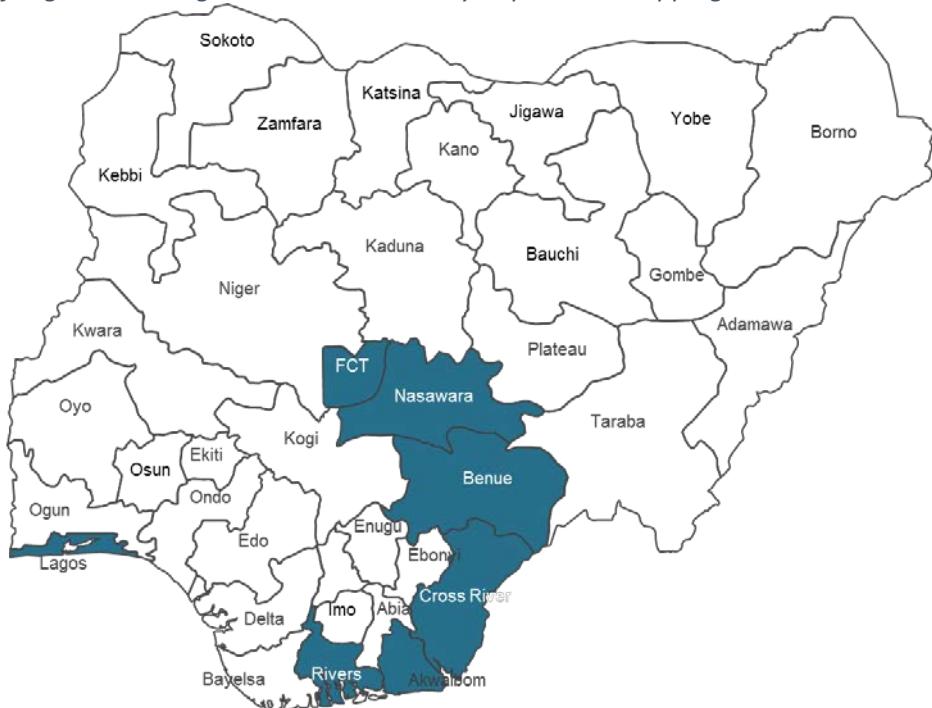

1.3. Study Population

FSW	Any woman (female sex at birth) 15 years and above who has received money or goods in exchange for sexual services, either regularly or occasionally, in the 12 months preceding this activity.
MSM	Any man (male sex at birth) 15 years and above who has engaged in oral and/or anal (receptive or insertive) sex with another man at least once in the 12 months preceding this activity.
PWID	Any person 15 years and above who has injected drugs (illicit, non-prescribed, and illegal) recreationally at least once in the 12 months preceding this activity

1.4. Study Locations

The population size estimation study was conducted in the 6+1 PEPFAR priority states of Akwa Ibom, Benue, Cross River, Lagos, Nasarawa, Rivers, and the FCT.

Figure 1: Map of Nigeria showing States included in Key Population Mapping and Size Estimation Exercise

1.5. Study Activity and Timeline

The study comprises three primary data collection activities: formative assessment, hotspot mapping and validation, and multiple-source capture-recapture (MS-CRC). Formative assessment took place in July 2018, followed by hotspot mapping and validation in August 2018. The first three rounds of captures occurred during October and December 2018. The fourth (facility-based) capture round was completed during January 2019.

	Oct - Dec 2017	Jan - Mar 2018	Apr - Jun 2018	July - Sep 2018	Oct - Dec 2018	Jan - Mar 2019
Protocol and SOP Development						
Formative Assessment						
Hotspot Mapping and Validation						
Multiple- source Capture-recapture (four sources)						

A note about terms used in this report:

- There were four rounds of capture-recapture implemented in this study
 - Capture rounds 1, 2, and 3: Unique objects distributed in venues or hotspots
 - Capture round 4: Facility-based capture round based on a client registry
- Multiple-source capture-recapture (“MS-CRC”) refers to all four capture rounds that were implemented during October 2018-January 2019
- Three-source capture-recapture (“3S-CRC”) refers to the first three capture rounds implemented during October-December 2018
- All population size estimates were calculated using 3S-CRC results, i.e., data collected during the first three capture rounds with unique object distribution in hotspots

2. Hotspot Mapping and Validation

2.1. Methods

During August 2018, 261 trained KP enumerators from 36 KP-led community-based organizations (CBO) in 6+1 PEPFAR priority states mapped, validated, and profiled all hotspots identified during formative assessment. For each hotspot, enumerators recorded geographic coordinates, peak day/time of KP activity, name, address, and estimated number of KP present. Reconciliation of information obtained from this field exercise was used to sieve out duplicate submissions and verify information submitted between August and November 2018, immediately before the first capture round of 3S-CRC.

2.2. Results

Of the 13,899 KP hotspots mapped and validated during the exercise, FSW hotspots accounted for 69.0%, MSM hotspots accounted for 11.3%, and PWID hotspots accounted for 19.6%. Although more hotspots were found in urban areas and state capitals, hotspots were identified in rural areas and the majority of local government areas (LGA) visited. Enumerators found far fewer MSM hotspots compared to FSW and PWID hotspots. The largest number of hotspots were observed in Lagos, Cross River, and Rivers States.

Table 2: Number of Hotspots by Key Population in 6+1 PEPFAR Priority States

Figure 2.7: Number of KP Hotspots per 100,000 persons by key population and LGA in Rivers State from Hotspot Mapping and Validation, 2018[‡]

[‡]Number of key population (KP) hotspots presented in the map represent findings at the end of hotspot mapping and validation (HMV), immediately before three-source capture-recapture (3S-CRC) activities began. Hotspots are dynamic with frequent changes in activity status. Hotspot mapping, validation, and data reconciliation occurred between August 15 and October 21, 2018. LGA of KP hotspots were indicated by enumerators, with maps representing number of KP hotspots per 100,000 population per LGA. Population estimates by LGA were obtained from <https://www.citypopulation.de/php/nigeria-admin.php>, March 13, 2019. Shape files of Nigeria geographic boundaries were obtained from <https://data.humdata.org/dataset/nga-administrative-boundaries>, Office of the Surveyor General of the Federation (OSGOF), eHealth, United Nations Cartographic Section (UNCS) and were valid as of Feb 23, 2017.

[§]Population estimates by LGA were obtained on March 13 2019 from <https://www.citypopulation.de/php/nigeria-admin.php> as the official website to Nigeria National Population Council (NPopC) was down and inaccessible at the time.

For this study, the following definitions were used: 'Street/public place' was defined as any outdoor area accessible to the public. These included streets, under bridges, organized motor parks, unnamed drinking places, mechanic villages, and bus stops. 'Hostel/campus' was defined as an area near student living apartment/hostels of a secondary, polytechnic, or university level academic institution meant for student relaxation, academic and/or social meetings. KP hotspots not captured in the categories as described in the protocol were classified as 'Other'. These included car wash, shops, bakeries, and health facilities providing services to KP, e.g., U.S. Government (USG) supported One-stop Shops (OSS). Figures 3.1 to 3.3 and tables 5.1 to 5.3 show the proportion of each type of hotspot found for each KP group.

Figure 3.1: Type of FSW Hotspots by State

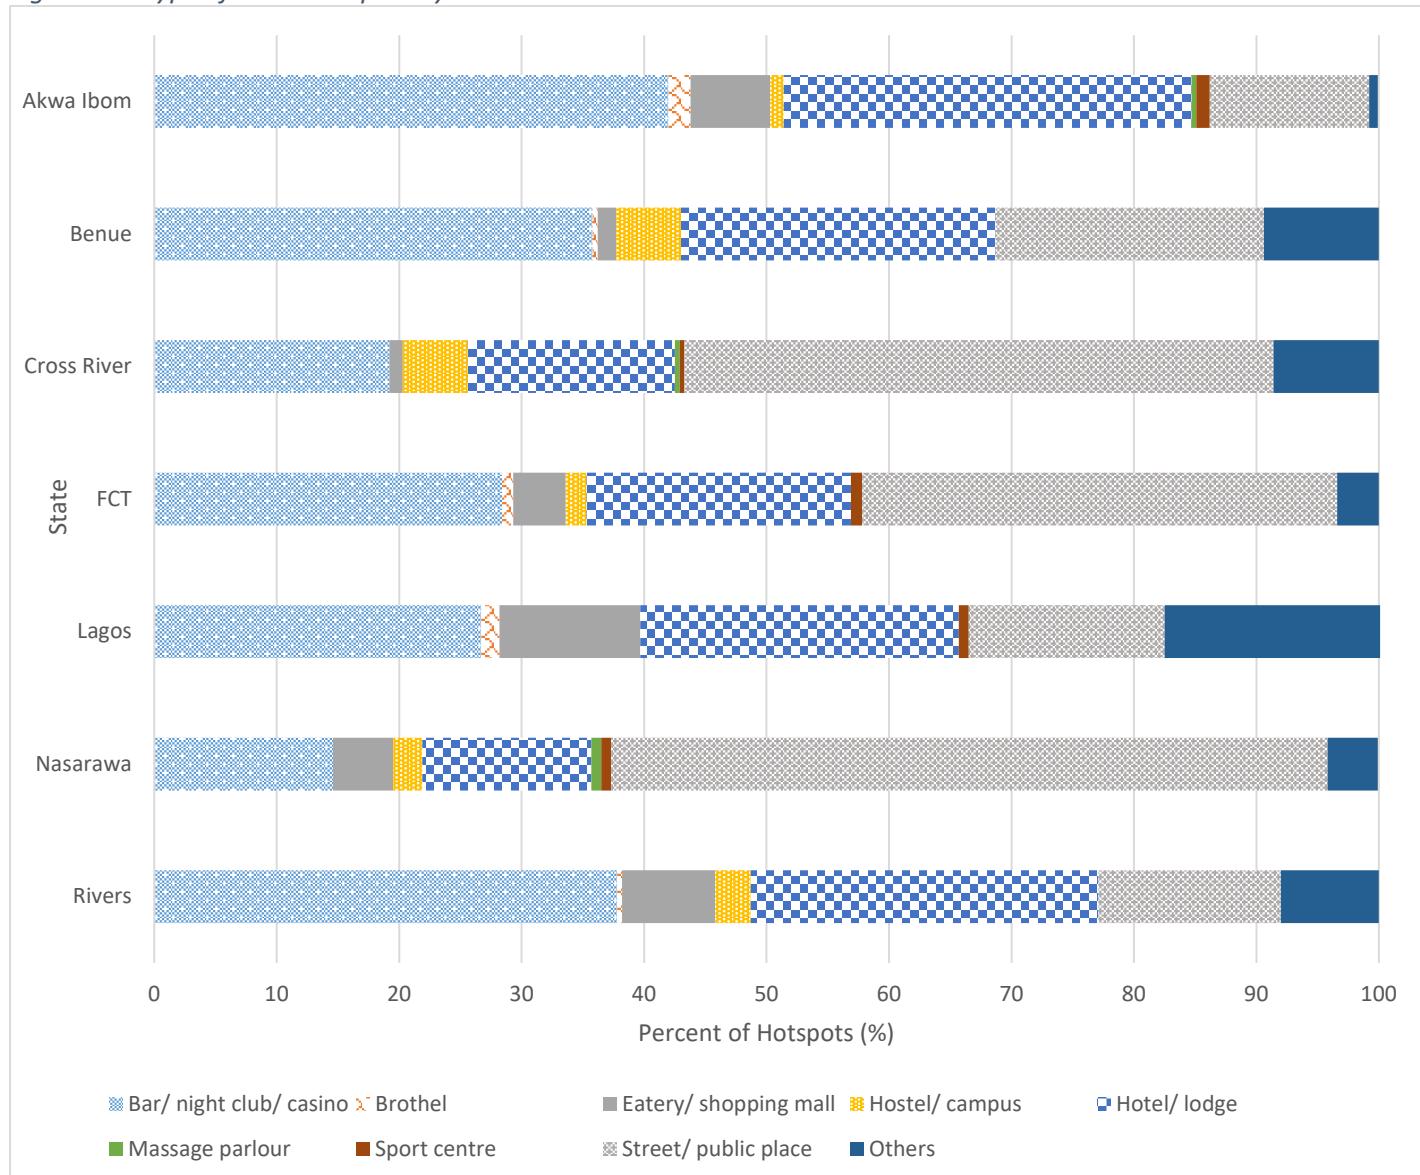

Examples of other hotspot types include restaurants and gardens.

Tables 5.1 to 5.7 show the most commonly reported peak KP activity period by each KP group and type of hotspot in the 6+1 states. Morning was defined as any time before 12 noon, afternoon between 12pm to 5pm, evening between 5pm to 9pm, and night as any time after 9pm. Fields are listed as N/A if the hotspot type did not apply to the corresponding state and/or KP group; e.g., sport centres were not identified as hotspots for FSW or PWID.

2.3. Challenges and Limitations

Hotspots are dynamic. Some previously enumerated hotspots had either closed or moved prior to the mapping and validation exercise. In total, 528 hotspots were closed, moved, or absent of KP-defining activity between hotspot mapping and the third capture round of 3S-CRC. Formative assessment activities included updating lists of hotspots and there were challenges including duplicate or inaccurate information (names, nicknames, and addresses) and inaccessibility due to security challenges and inclement weather conditions. These challenges affected a negligible number of hotspots and are unlikely to have impacted the results of this study.

3. Three-source capture-recapture (3S-CRC)

Three-source capture-recapture (3S-CRC) methodology was used to estimate the population size of FSW, MSM and PWID. This method determines population sizes based on identifying individuals who appear in one, two, three (or more) “captures” within a specified timeframe. Individuals were offered inexpensive, but memorable unique objects. If the respondent accepted the object, he/she was considered “tagged” and, in each round, the aggregate number of those who are newly tagged or are “recaptures” from previous round(s) were ascertained. This method allows estimation of the number who have not been captured, and then consolidates estimates of the “unobserved” with counts of the “observed” to estimate total population size. Adding one or more sources to traditional (two sources) capture-recapture studies strengthens the design and produces more robust estimates. Furthermore, the assumption of source independence is also relaxed with the additional sources as Bayesian latent-class models account for heterogeneity of capture probabilities⁷.

Assumptions for all capture-recapture⁸

- All identified individuals meet the target population definition
- Each “capture” and “recapture” are correctly identified
- Homogeneity of capture probabilities; each population member has an equal chance of being captured
- Data sources, or captures, are independent and not correlated
- The study population remains constant over the study period; no migration in or out of the population

3.1. Methods

Between October and December 2018, we sampled FSW, MSM, and PWID during three independent captures in active hotspots identified during the mapping and validation activity. During encounters in KP hotspots, distributors offered inexpensive and memorable objects to FSW, MSM, and PWID that were unique to each round of capture and KP. Eligible respondents who consented were considered enrolled in this population size estimation activity. In subsequent rounds, 1-2 weeks apart, participants were asked to describe objects they had received during previous rounds, and affirmative responses were tallied upon correct identification of the object. Distributors recorded information on tablets with REDCap™ software and uploaded to a secure central server after each encounter. Data were aggregated by state, KP, age group, and sex (where applicable) for analysis. PSE were derived using Bayesian nonparametric latent class models for capture-recapture.

Table 6: Summary of Unique Objects Distributed During Each Round of Capture

Round of Capture	Distribute	Inquire about having previously received:
Capture 1 (C ¹)	Tag 1	
Capture 2 (C ²)	Tag 2	Tag 1
Capture 3 (C ³)	Tag 3	Tag 1 and/or tag 2
Capture 4 (C ⁴) (facility-based capture)	Tag 4 (catchphrase)	Tag 1, tag 2, and/or tag 3

Key population members between 15 and 17 years of age who identified as sex workers, victims of violence, or victims of human trafficking received referrals to local organizations that provide relevant support services.

Referral forms documented the date of the referral, name of local organization, type of services provided by the organization, and a unique, alphanumeric referral code. Organizations were contacted by CBO partners at weeks 1, 4, and 7 after the referral, using the referral code to determine if the KP member had accessed support services at the facility.

3.2. Study Population

Eligible participants were at least 15 years of age, displayed understanding of study objectives, consented to participate, had not already been captured in the current round of 3S-CRC, accepted the unique object/ tag distributed by enumerators, and self-reported engaging in KP-defining behaviour within the previous 12 months (section 1.3).

To satisfy the assumption of homogeneous capture probability across data sources, analyses were restricted to individuals who were captured/ recaptured at hotspots that were visited in all three rounds of venue-based 3S-CRC. In other words, if a hotspot was not visited in the second round of 3S-CRC, any individuals captured/ recaptured at that hotspot in rounds 1 or 3 were excluded.

3.3. Data Analysis

Participant-level data from REDCap™ was exported into SAS and exclusion criteria were applied. Participants were subset by state, KP group, age, and sex (where applicable), and aggregated datasets detailing counts of each capture/ recapture combination were produced for each subset. Bayesian nonparametric latent-class models were used to produce PSE from aggregate data sets. A maximum of 10 latent components were specified for each model. Sampling parameters for each PSE included 100,000 samples from the posterior distribution using Markov Chain Monte Carlo computation, thinning was set to 100 (higher if effective sample size was too small), and burn in was at least 10,000 to promote unbiased estimates. All analyses were performed using the Latent-class model for capture-recapture (LCMCR) package in R version 3.4.4. PSE median population size with 95% credible sets for three-source and four-source CRC were output for each KP by state. The posterior distribution for latent-class models were skewed, producing very wide credible intervals with a long tail. To facilitate interpretation of results and application of estimates for programs, we calculated 80% highest density intervals and presented those in this report.

3.4. Results

In total, 310,140 encounters from capture rounds one, two, and three of 3S-CRC were included in analyses (all states and KP groups).

Table 7: Number of Encounters by State and KP Group

State	KP Group			
	FSW [†]	MSM [∞]	PWID [*]	Total

[†]FSW: Female Sex Workers

[∞]MSM: Men who have Sex with Men

^{*}PWID: People Who Inject Drugs

These figures represent enrolment per round of data collection, not size estimates.

Key population members were enrolled into the study if they were eligible, consented to participation, and accepted the unique object. There were 88,805 individuals excluded due to ineligibility or non-consent, including 74,349 captures/ recaptures from hotspots that were not visited in all three rounds of 3S-CRC. This is described in greater detail in the challenges and limitations section. Round four, facility-based encounters, defined as a phone call from a KP-friendly facility staff to KP clients who had presented at the clinic within the previous six months, were also excluded from PSE. Despite overlap in catchment areas, data suggested minimal interaction between the facility-based and hotspot-based members of each of the KP from the first three rounds. Section 4.5 provides additional detail and justification.

Tables 8.1 to 14.7 detail demographic characteristics of enrollees, summaries of enrolment, and age-stratified PSE for each state. Demographic results were stratified by state and KP group, and only the first capture of each participant was included in analysis to avoid double-counting individuals who were captured in multiple rounds. Newly captured participants refer to individuals who did not recall accepting an item from an enumerator. Median and interquartile range (IQR) of age, and frequencies by age group, highest education level, and primary occupation were evaluated for newly captured participants. Note that highest education level does not necessitate completion/ degree attainment. Demographic tables for MSM and PWID also describe self-reported engagement in sex work, and sex at birth was included for PWID.

Age-stratified PSE are provided for all KP groups, with PWID PSE additionally stratified by sex at birth. Enrolled participants were at least 15 years of age, self-reported sex in exchange for money or gifts within the previous 12 months (FSW), anal or oral sex with another man within the past 12 months (MSM), and/or injection drug use within the previous 12 months (PWID), displayed understanding the study objective, consented to participate, had not already been captured in the current round of 3S-CRC, and accepted the unique object/tag distributed by enumerators. Born-male FSW and born-female MSM were excluded from PSE as there were not enough encounters to generate separate, reliable PSE. All numbers reflect newly captured and recaptured participants.

Median PSE rounded to the nearest hundred with 80% highest density intervals are presented for each KP by state. Results are presented in context of the 2015 National Population Commission (NPopC) of Nigeria general population census projections to aid interpretation. In the right-most column of each table, the proportion of KPSE relative to the general population was calculated (median PSE divided by the corresponding NPopC general population census projection). All models were run using data from rounds one, two, and three of venue-based 3S-CRC. Data collected during round four (i.e., facility-based capture) was excluded from analysis.

Helpful Tips for Interpreting Population Size Estimates

- These are model-based estimates and not census counts or enumerations of KP members.
- The study was conducted in six unique and independent states and FCT. Results are not meant to be combined to represent a regional or national PSE.
- Population size estimates are presented with highest density intervals to support flexible program planning and adjustment.

3.4.1. Akwa Ibom

Table 8.1: Demographic Characteristics of Newly Captured FSW from Rounds 1-3 of Venue-based Capture-recapture in Akwa Ibom State, 2018

Characteristic	Category	Median (IQR) / n (%)
Age (years)	Median (IQR)	26 (24-31)
Age group (years)	15-19	310 (1)

3.4.1.1. Discussion

FSW

Of FSW encountered in Akwa Ibom, 56% were between 25-34 years old and 72% reported an education level of senior secondary school or higher. Formative assessment results, supported by State Technical Team experience, indicated a large number of FSW in Akwa Ibom who primarily engage their clients using online platforms. The subset of FSW who operate exclusively online would not be represented in estimates from hotspot-based 3S-CRC. Security incidents reported in some FSW hotspots during 3S-CRC might have resulted in fewer captures, impacting capture probabilities and resulting PSE.

MSM

Among MSM encountered during 3S-CRC activities, 89% were between 20 and 34 years old, 91% reported senior secondary or higher as their highest level of education, and 77% reported engaging in sex work. Potential influences on capture probabilities and PSE included MSM hotspots that were difficult to access, such as private residences and invitation-only events, as well as frequent security incidents.

PWID

The majority of PWID were 25 years or older (79%), male (87%), and reported senior secondary or higher as their highest level of education (77%). Fifty-three percent (53%) of female PWID reported engaging in sex work. Potential limitations included security incidents reported at hotspots and limited coverage of female PWID.

3.4.2. Benue

Table 9.1: Demographic Characteristics of Newly Captured FSW from Rounds 1-3 of Venue-based Capture-recapture in Benue State, 2018

⁺NPopC census projection for 2018 population shown are age and sex-specific for each PSE

3.4.2.1. Discussion

FSW

In Benue State, 86% of FSW participants were between 20 to 34 years of age, and 50% reported senior secondary school or higher as their highest level of education. During formative assessment, Benue was the only state to report low online-based KP activities due to poor internet connectivity. The resulting increase in social visibility of FSW in hotspots increased robustness of the PSE.

MSM

The majority of MSM participants were between 20 to 34 years of age (90%), reported senior secondary school or higher as their highest level of education (93%), and engaged in sex work (86%). Low participation in online-based MSM activity improved social visibility in hotspots and increased robustness of PSE.

PWID

Most participating PWID were between 25 to 34 years of age (60%) and male (89%) with senior secondary school or higher education (81%). Limitations included poor social visibility of female PWID. To improve model precision, male and female PWID captures were combined for the final PSE.

3.4.3. Cross Rivers

Table 10.1: Demographic Characteristics of Newly Captured FSW from Rounds 1-3 of Venue-based Capture-recapture in Cross River State, 2018

3.4.3.1. Discussion

FSW

In Cross River State, the majority of FSW encountered were between 20-34 years of age (89%), and reported an education level of senior secondary school or higher (71%). Multiple-source capture-recapture was conducted throughout the festive period in December. Carnival celebrations during this time resulted in a huge influx of FSW, which likely affected capture probabilities. There were some challenges among the FSW with acceptance of the unique objects that might have influenced capture probabilities and resulting PSE.

MSM

Of the MSM encountered during 3S-CRC activities, the majority were between 20-34 years of age (87%), reported an education level of senior secondary school or higher (86%), and reported engaging in sex work (94%). The influx of MSM during the festive period might have influenced capture probabilities and resulting PSE.

PWID

The majority of PWID enrolled in the study were male (91%), between the ages of 25 to 34 (61%), and reported an education level of senior secondary school or higher (73%). Acceptance of unique objects in PWID hotspots was a challenge observed during field monitoring visits and might have impacted capture probabilities and resulting PSE.

3.4.4. FCT

Table 11.1: Demographic Characteristics of Newly Captured FSW from Rounds 1-3 of Venue-based Capture-recapture in FCT, 2018

3.4.4.1. Discussion

FSW

In FCT, 85% of FSW participants were between 20 to 34 years of age, and approximately half (53%) reported senior secondary school or higher as their highest level of education. Population size estimates for this group were consistent with previous studies.

MSM

The majority of MSM encountered in FCT were 25 years or older (71%) and reported senior secondary school or higher as their highest level of education (76%). Half (47%) reported engaging in sex work. Younger, non-emancipated MSM, and those of higher social status were unlikely to be found at hotspots. The poor social visibility of these sub-groups might have impacted capture probabilities and resulting PSE.

PWID

Of PWID encountered in FCT, 65% were between the ages of 25 to 34, 83% were male, and 54% reported senior secondary or higher as their highest level of education. Forty-seven percent (47%) of female PWID reported engaging in sex work. Sparse participation among female PWID influenced capture probabilities and resulting PSE.

3.4.5.1. Discussion

FSW

Of the participating FSW in Lagos State, 62% were between 25 and 34 years, and 47% reported senior secondary school as their highest level of education. An influx of FSW during the holidays in December resulted in a sharp increase in enrolment during the final capture round. There were challenges with unique object acceptance among FSW that might have impacted capture probabilities and resulting PSE.

MSM

Of participating MSM, 56% percent were between the ages of 25 and 34, 93% reported senior secondary school or higher as their highest level of education, and 64% reported engaging in sex work. The relatively few hotspots identified suggest that many MSM in Lagos may not spend time in hotspots, but rather engage in social activities exclusively online or in venues not specific to MSM; thus, PSE might not be representative of all MSM.

PWID

Of PWID, 86% were 25 years or older, 86% were male, and 57% reported senior secondary school or higher as their highest level of education. Forty-five percent (45%) of female PWID reported engaging in sex work.

3.4.6. Nasarawa

3.4.6.1. Discussion

FSW

Of the participating FSW, 87% were between the ages of 20 and 34, and 54% reported senior secondary school or higher as their highest level of education. The PSE do not account for FSW who are exclusively home-based and not found in hotspots, but the proportion of home-based FSW among all FSW is unknown. For that reason, the impact of excluding this sub-population on the PSE is unknown.

MSM

The majority of MSM were between the ages of 20 and 34 (89%), with senior secondary school or higher as their highest level of education (77%), and reported engaging in sex work (98%). Challenges with unique object acceptance among MSM and high interstate mobility during 3S-CRC might have impacted capture probabilities and resulting PSE. Security threats from cult clashes were reported in several LGAs that might have influenced hotspot activity, resulting in an unknown impact on the PSE.

PWID

The majority of PWID encountered during 3S-CRC were male (90%), between the ages of 25 and 34 (70%), and reported senior secondary school or lower as their highest level of education (78%). Seventy-four percent (74%) of female PWID reported engaging in sex work. Population size estimates might have been impacted by security threats in some hotspots and poor social visibility of PWID with higher social standing.

3.4.7.1. *Discussion*

FSW

The majority of FSW encountered in Rivers State were between 25 and 34 years of age (50%) and reported senior secondary school or higher as their highest level of education (51%). Data collection in Rivers State occurred throughout December, during which many FSW traveled to neighboring states for festivals; this might have impacted capture probabilities in Rivers State hotspots and influenced PSE.

MSM

Among MSM encountered during CRC activities, 81% were 25 years old or older, 84% reported senior secondary or higher as their highest level of education, and 57% reported engaging in sex work. Enumerators reported challenges accessing a number of hotspots, which might have had an impact on capture probabilities and resulting PSE.

PWID

The majority of PWID encountered during CRC were 25 years old or older (93%) and 80% reported their educational level as senior secondary school or higher. Sixty-three percent (63%) of female PWID reported engaging in sex work. Difficulty accessing hotspots might have impacted capture probabilities and resulting PSE.

3.5. Facility-based Capture

Data sources for the fourth, facility-based round of MS-CRC included 24 one-stop shop (OSS) client registries and the TRUST/RV368 cohort of MSM in Abuja. Between December 2018 and February 2019, 82 trained facility staff from 24 OSS and the TRUST clinic, identified a total of 7,156 eligible clients from facility registries to be contacted in the fourth round of MS-CRC. Clients were eligible if KP-defining behaviour was documented and they had presented at the clinic within the previous six months. Facility staff were trained in study procedures, interview etiquette, and data collection in REDCap™, and began contacting participants following completion of venue-based capture rounds. The facility-based questionnaire (Appendix section 6.4) was administered over the phone by clinic staff and was similar to those used in previous rounds.

There were 7,156 clients from the OSS client registries who responded, consented, and were eligible for inclusion in the fourth capture round. Only 20% (FSW 13%; MSM 32%; PWID 11%) recalled ever being approached by an enumerator or receiving a unique object, suggesting minimal overlap between OSS clients and KP encountered at hotspots. It was later found that limiting eligibility to clients who had presented at the clinic within the previous six months unintentionally biased the sampling frame towards a HIV-positive clientele. In most states, the KP who consented were obtained from the HIV treatment registry, excluding those on the HIV testing and counselling registry. When combined, the negligible overlap between hotspot and facility-based capture rounds resulted in hyper-inflated PSE, some increasing tenfold. For that reason, model results are not presented here. Further analyses will be performed to understand the relationship between KP in hotspots and those with HIV-related regular clinic attendance.

3.6. Challenges and Limitations

Of the 13,899 documented hotspots mapped in preparation for 3S-CRC, 8,885 were visited during all three capture rounds. Maintaining a detailed, comprehensive hotspot inventory was a challenge due to the dynamic nature of KP hotspots. Names, exact locations, and KP presence fluctuated between capture rounds, and security incidents rendered some hotspots entirely inaccessible. Time constraints, coupled with challenging terrain and unfavourable weather conditions also limited hotspot coverage. Capture-recapture encounters from 4,973 hotspots were excluded from analysis as they were not visited in each of the three venue-based rounds due to challenges described above. To understand the effect this may have on PSE, demographics of encounters excluded were compared to included encounters. No notable differences were found between excluded encounters and encounters used in PSE models.

In Lagos, Rivers, and Cross River States, venue-based 3S-CRC extended through the holiday period in December 2018. Travel to and from neighbouring states for holiday festivities was evident in the final rounds of data collection, particularly in Lagos and Rivers States. In Lagos, there was an increase in the number of KP present at most hotspots, largely due to holiday-related parties or other events, and the majority of these participants were new captures. Conversely, data from round three in Rivers State suggested that many KP had left the area by mid-December, particularly FSW. This was affirmed by enumerators, who reported that many FSW had travelled to neighbouring Cross River for the carnival.

Limited resources prevented implementation of an online-based round of 3S-CRC. Formative assessment findings suggested that, with the exception of Benue state, online social platforms are widely used by KP in the 6+1 states. Virtual hotspots provide an opportunity to reach those with poor social visibility at hotspots; an online capture round might have improved the representativeness of the PSE.

Due to the structure of the REDCap™ questionnaire, it was not possible to calculate a response rate. The survey instrument begins with eligibility, followed by a description of the study objective, after which the respondent is asked whether or not he/ she would like to participate. Because consent is not prompted unless the individual self-identifies as a KP member and displays understanding of the study objective, the non-consenting population could not be documented. Initiating the questionnaire with whether or not the

individual was willing to be approached may have elicited a better view of the response rate, although it would have relied heavily on an enumerator's judgment in terms of accurately identifying KP members.

4. Conclusions

The PSE presented in this report were larger than previously documented in Nigeria. Empirical methods and analysis using Bayesian models that account for heterogeneity in capture probabilities may reflect more accurate size estimates compared to methods applied in previous studies. These population data are critical to inform HIV prevention and treatment programs and the large PSE suggest a need for programmatic scale-up to reach these populations at highest risk for HIV. Due to the fluctuating nature of KP—KP may start/stop engaging in behaviour and/or migrate to different geographic locations—PSE can change and efforts should be made to update them every two to three years.

The PSE as described in this report represent only one component of a larger key population size estimation strategy to inform policy and programming in Nigeria. PSE from the Network Scale-up Method (NSUM) as part of the Nigeria HIV/AIDS Indicator and Impact Survey (NAIIS) adjusted for transmission error by the Game of Contacts will be available soon. Results from these studies will be triangulated, and, where appropriate, extrapolated to areas of Nigeria without PSE, and summarized in a separate report.

5. Recommendations for future PSE

- Planning
 - Allow sufficient time for a comprehensive formative assessment to gather all necessary information from community members about mapping/validation of KP hotspots and the capture-recapture data sources, unique objects, online social platforms, etc.
 - Key population members should be part of the unique object selection process during formative assessment.
 - Schedule data collection activities outside of festive periods, election season, and other major events. Migration in and out of states and increased/decreased activity in hotspots may influence capture probabilities and affect PSE.
- Implementation
 - Dispatch well-trained community mobilizers to work with gatekeepers and community influencers to improve participation and avoid security incidents and any adverse responses from KP and unique objects.
 - Incorporate intensive field monitoring and central data repository monitoring for timely identification and resolution of potential data quality issues.
 - Collaborate with CBOs to coordinate prevention education and intervention efforts in tandem with 3S-CRC activities, e.g., condom distribution.
 - Include a capture round using an online social platform. This will broaden the populations reached, particularly those with poor social visibility in physical hotspots.
- Analysis
 - Opt for latent-class models that account for heterogeneity of capture probabilities instead of log-linear models.
 - Consider highest density intervals for improved interpretation and application to inform program and policy.
- Dissemination
 - Schedule national and state representatives to meet, review, and provide context for model results.

7. Appendices

7.1. Formative Assessment

7.1.1. Appendix A: Formative Assessment Methods

In July 2018, a series of advocacy visits took place in 6+1 PEPFAR-funded states to enlist KP stakeholders and community gatekeepers for participation in a formative assessment. Primary goals of the formative assessment were to update a KP hotspot inventory obtained from various stakeholders including Heartland Alliance International (HAI), Society for Family Health (SFH), and NACA, and to prepare for 3S-CRC. During visits, key informant interviews (KII) and focus group discussions (FGD) were conducted with KP members and staff of the State Agency for the Control of AIDS (SACA), KP CBOs, and referral facilities. KII and FGD guides can be found in Appendix D and E. Participants were asked about social networks, virtual social platforms, service access, security issues, unique object preferences for 3S-CRC, and approaches for selection of enumerators for mapping and 3S-CRC. Altogether, in the 6 + 1 States, the formative assessment consisted of 189 FGDs involving 2,079 KP participants and 112 KIIs.

Key objectives:

- To update list of venue-based KP hotspots in the 6+1 states
- To explore other facility and online-based platforms frequented by KP members
- To elicit appropriate method to identify, approach, and confirm KP membership
- To identify appropriate unique objects (i.e. gifts) to be utilized in 3S-CRC
- To identify appropriate procedures for community entry
- To identify security measures during data collection
- To ensure the overall feasibility and acceptability of study plans

Key findings from the formative assessment

- Additional hotspots from the initial list compiled from NACA, SFH, and HAI were identified and used to update the inventory, with KIIs and FGDs confirming location and KP activity.
- Common online platforms in use among KP included WhatsApp (all KP), Instagram (all KP), Facebook Messenger (FSW and MSM), Badoo (FSW and MSM), Manjam (FSW and MSM), and Grindr (MSM). In general, respondents reported that only MSM and FSW use social media to communicate with other KP members and/or solicit clients or sexual partners; PWID do not use social media for KP-defining activities, only social use.
- Informing influential KP and local gatekeepers such as village heads, area boys, local civil task forces, and other law enforcement bodies, is crucial to ensure security of enumerators and KP, and to facilitate community entry.
- Overall, most acceptable unique objects (i.e., gifts) by KP members were:
 - FSW—Face towel, small mirrors, keychain pens
 - MSM—Wristbands, key tags
 - PWID—Face towel, key tags, sunglasses

7.1.2. Appendix B: Formative Assessment Summary of Major Findings and Themes

Question 1: Where and when do KP members congregate?

Focus group discussion and KII participants worked in groups to validate known hotspots from the initial inventory compiled by HAI, NACA, and SFH during prior PSE and outreach exercises. Hotspots not already listed were appended to the inventory.

In Rivers KII, SACA officers commented on high inter-State mobility among FSW.

“Now they are in Rivers, tomorrow it is Abuja” (Rivers)

In Lagos, teams reported that KP members were sometimes reluctant to disclose the location of newfound hotspots.

Question 2: Aside from physical venues, which other platforms do KP members meet?

Most local experts and FGD reported that although MSM and FSW use social media to solicit clients, sexual partners, and/or interact with other KP members, it is not a common mode of communication among PWID. A headcount of PWID in Rivers revealed that only three of the twelve PWID present had access to a personal phone. During FGD, several PWID remarked that KP members were not clustered in any virtual space.

Comment from FSW on social media platforms:

“As I dey here wey una dey talk sef, I dey busy dey sell my market oo (source for Clients). E-Messenger dey wey some of us dey use sell our market” (Akwa Ibom)

Perceived social media use among specific KP groups varied by state, as participants from Rivers State claimed that MSM and PWID tended to use online group features more than FSW. While FSW used these platforms to solicit clients, MSM and PWID used group features to interact and connect with each other. Facebook and WhatsApp were reported to be the most popular social media platforms across KP groups. In Benue, social media was reported to not be a common mode of communicating with clients and/or other KP due to the poor availability of network and electricity associated with poor living conditions and infrastructure. Some FSW reported using Facebook, IMO, WhatsApp, and Instagram to reach new clients; however, they still relied heavily on physical hotspots. Pimps were reported to operate via one-on-one verbal communication, telephone calls, and text messages.

Question 3: How can enumerators identify, confirm and approach a KP member?

There was consensus among KP that the successful identification and engagement of KP in hotspots must be accomplished by KP gatekeepers and/or KP community escorts. In short, the three KP communities agreed that to reach any KP, KP members must be fully involved throughout the study. Participants also suggested the use of incentives in the form of gifts and/or money to improve participation in the study.

Community gatekeepers by KP group

- **FSW:** Community influencers, CBOs, chairladies, bar/brothel managers/owners, Aproko Boys (Lagos and FCT)
- **MSM:** Community influencers, well-connected MSM
- **PWID:** Bunk owners, community influencers /“the senior men”, well-connected KP members familiar with coded language (e.g., “on board” signifying an active PWID, “coco, csp, limp” as slang for codeine)

Question 4: What do we need for community entry?

Key population gatekeepers and KP members have unique access to hotspots and KP communities through their credibility and contacts. Utilization of KP social and personal networks will facilitate entry into community, ensuring safe and discrete process.

Other key elements of community entry included: advocacy, education, and mobilization. It was emphasized that all stakeholders must be aware of specific study procedures and timelines. In addition to study stakeholders, participants suggested liaising with local chiefs, village heads, youth leaders, and similar figureheads prior to the start of any fieldwork.

Key gatekeepers and other notes for community entry by KP community

FSW: chairladies, managers, stone boys (special boyfriends), maga hajiyas

One FSW noted:

“If una wan see us, make una see our Madams and Managers and this CBO who our managers and even us sabi” (Rivers)

MSM: MSM key influencers

Although physical venues exclusively for MSM are uncommon, strong MSM communities can be found in social media and online platforms. In Lagos, Eventbrite was cited as a means of RSVP-ing to MSM-exclusive parties.

PWID: Bunk owners

Common observations from PWID members included the “tradition” of pouring drinks on the floor by guests, a strict “code of conduct” for behaviours that is internal to bunks/ PWID communities, and the importance of greeting the chief security officer of the barrack prior to entry.

“Abeg una go find way inform all the drug lords or bunk owners on time make them no feel say we dey sell out our locations to the police. Because anything way happen (Police arrest) within that period wey the program dey go on, them go say na una bring them come.” (Rivers)

Question 5: What challenges have you faced when working with KP members and how have you been managing them?

FSW

- Gender-based violence was a strong theme. FSW suffer attacks in the hands of the vigilante groups and uniformed service men especially the Special Anti-Robbery Squad (SARS) and Joint Task Force (JTF).
- Key population members can be rude. Enumerators were advised to exercise patience when dealt with bad behaviour.
- The study team should maintain a mix of female and male enumerators as some FSW prefer to talk to men while others to women.
- Encounters should be kept as brief as possible. It is important to respect FSW business hours. FSW may expect monetary incentives for their time.

MSM:

- The study team should recruit “classy/ high-profile” enumerators and provide condoms and lubricants to maximize participation.
- Study investigators should consider language barriers as some MSM do not understand English.
- Many MSM are in denial about their sexual orientation which may pose a challenge to fieldworkers. Due to the harsh environment, specifically, the 2015 Same-Sex Prohibition Act, many are conscious and sensitive about their safety.
- Enumerators should avoid asking personal questions. The latter applies to all KP but especially MSM. Enumerators should also respect individuals’ privacy.

PWID

- People who inject drugs are quick to raise alarm and regard outsiders within their territory as a threat. This can be managed through prompt and proper community entry, and engagement of gatekeepers and KP members.
- People who inject drugs should not be kept for too long at the study site or hotspot to avoid them being restless and/or hyperactive.

Question 6: What additional security measures are needed to ensure safety of enumerators and study participants in this locality?**Engagement of law enforcement, key local stakeholders and KP members**

Focus group discussion and KII participants emphasized the importance of engaging law enforcement, key local stakeholders, and KP members in ensuring safety of all involved in the study. Law enforcement includes the Local Action Committee on AIDS (LACA), National Drug Law Enforcement Agency (NDLEA), state-specific law enforcement (SARS, Civil Defence, task force) and local vigilante. Government ownership, coordination, and commitment is crucial. Advocacy to the police commissioner, in addition to Police Action Committee on AIDS (PACA), is needed. The police should be notified of activity days and key officers contacted in case of incidents. In all states, measures must be taken by the government to cover for security, and suspend strike force operations during the study period.

Appropriate dressing

Focus group discussion and KII participants advised against official uniforms and flashy clothing that will attract unnecessary attention. Casual clothing should be worn to gain acceptance and to better assimilate to the surroundings. In addition, enumerators were advised against flaunting of expensive items such as phones and tablets. Boots, raincoats, and umbrellas should be provided to ensure the security of enumerators, especially if fieldwork is to be conducted during the rainy season.

Leaving on time in areas of high security risks

Several high security risk areas were brought up during FGD and KII discussions. These include Abaji, Gwagwalada, and Kwali localities in FCT, and Ikom LGA in Cross River State. Investigators and enumerators were advised to abide by curfews and ensure that the police are promptly notified when working in these areas.

Discrete security measures

Uniformed police officers and official law enforcement vehicles might alarm KP and should be avoided. The study team should plan for discrete security measures.

Effective Time management

Enumerators should be as brief as possible when speaking with KP members, and should avoid staying in any particular hotspot too long so as not to incite suspicion.

Making appropriate arrangement for challenging terrain and unfavourable weather conditions

In Cross River, informants reported that unfavourable weather, difficult terrain, and bad roads will pose challenges to enumerators. Study investigators should make appropriate arrangements to account for the challenging working conditions.

Question 7: What would be an appropriate ‘tag’/ unique object for the study?

The top choice for an appropriate tag differed by focus group; many items listed as choices were found to be appropriate as tags for KP participants.

Overall, these items were the most popular among the KP community members:

- **FSW:** Face towel/ handkerchief; small handheld mirror; keychain pens
- **MSM:** Wristband (watch design); wristband (regular, Tyvek); silicone key tags
- **PWID:** Face towel/ handkerchief; key chains; key tags; keychain pens; sunglasses

Recommendations from the Formative Assessment

The following recommendations were put forward in support of a successful enumeration exercise:

1. Adequate human resources and time should be allocated for fieldwork given the large number of hotspots to be covered.
2. If the study investigators intend to utilize online platforms, some means of verification should be incorporated into the exercise. For instance, the study investigators may randomly select individuals to be contacted for physical confirmation as a KP member and to avoid instances in where the same individual is presenting as two or more individuals on social media.
3. Security issues should be given due consideration. A means should be established to maintain continuous communication with field workers.
4. Advocacy to local security organizations especially the JTF, SARS and anti-cultism group should be done to ensure that enumerators are not harassed by area/cult boys. This must be done at the local police stations and not at the national-level.
5. Key populations must be represented in the study team. Key population members will respond more positively to a familiar face. This will help avoid trickery, beating, harassment, and extortions.
6. The MSM community suggested that legal assistance be provided to any enumerators or participants under risk of arrest or detainment during the course of the activity.

7.1.3. Appendix C: Formative Assessment Challenges and Limitations

1. Interviews of KP informants often took place in hotspots, where the environment could be volatile.
2. One FGD session was disrupted by aggressive individuals who were not part of the exercise.
3. Attendance of interviews and FGD sessions was hampered by extortion, violence, and other security concerns in the area.

7.1.4. Appendix D: Formative Assessment Key Informant Interview Guide

For SACA and KP CBO:

- 1) Data collector/ enumerator recruitment and selection criteria
 - a) What will be the best approach to recruit qualified and experienced enumerators for this exercise?
 - b) What selection criteria should be used in screening study enumerators for the MSM, PWID and FSW communities?
 - c) Do you have persons you would recommend? If so, please provide the list:
- 2) Where and when do KPs congregate?
 - a) List the LGA and specific intervention sites where you have worked or currently providing services for KP (FSW, MSM and PWID).
 - b) For each KP community, list hotspots in the area (with geocode information if available) and peak day/hours.
 - c) List other facilities in the state which provides services to KP members.
 - d) What are your challenges working with KP members and how have you been managing them?
- 3) How can a KP member be identified, approached and confirmed at a hotspot?
 - a) What dialogue, body language, and other social cues can be used to indicate intent to engage in KP behaviour of interest (transactional sex, needle sharing, or insertive/receptive anal sex among men) should enumerators look out for?
 - b) What would be an appropriate unique object for 3S-CRC?
 - c) In what areas can your organization support this activity?
- 4) What additional security measures should the study team plan for to ensure safety of enumerators and study participants?
 - a) KP CBOs to recommend informants and escort officers to facilitate entry of KP enumerators.
 - b) SACA to recommend emergency response number and relevant security agency to work with in the state.
 - c) Hotel owners and bunk owners to provide list of security tips.

For in-depth interview with bunk owners, chair ladies, party planners, MSM-friendly centres, hotel owners, etc...

- 1) Which is the majority KP group who visit this type of venue in the state?
- 2) List the KP groups who can be seen in this type of facility at peak periods.
- 3) Do KP found in this type of facility belong to any online platform? Name the possible platforms.
- 4) When is the most appropriate time to meet with KP members in a venue like this?
- 5) What are the major security issues in working with KP members in a venue like this?
- 6) Which law enforcement groups must the study team engage with for maximum security?
- 7) On average, how many of this type of venue exist in the state? List minimum and maximum.
- 8) In your opinion, what makes this venue appealing to these KP?
- 9) What verbal, body language, and other social cues to indicate intent to engage in KP behaviour of interest (transactional sex, needle sharing, or insertive/receptive anal sex among men) should enumerators look out for?
- 10) What would be an appropriate unique object to use for 3S-CRC? (show picture samples)

7.1.5. Appendix E: Formative Assessment Focus Group Discussion Guide

- 1) List all service delivery facilities in the state for each of the KP groups.
 - a. When did the facility begin servicing KP communities?
 - b. Which KP groups visit the facility?
 - c. List the services offered by the facility.
 - d. List the personal information collected from clients at these facilities.
- 2) Do FSW, MSM, PWID members have any active online-based networks? If so, please describe them.
 - a. List all online platforms popular among the MSM, FSW and PWID communities.
 - i) Of all listed, which platform has the largest number of FSW, MSM and PWID members?
 - b. What is the average number of members in each of the networks?
 - c. Do the platforms maintain a database of members' information such as state/LGA of residence, date of birth, name and/ or surname?
 - d. What is the predominant function of this online network/ platform?
 - e. Who manages this online network/ platform?
- 3) Where and when do KPs congregate?
 - a. List the LGAs and specific intervention sites where you have worked or currently provide services for KP members.
 - b. For each KP community: list hotspots in the area (with geocode information if available) and peak day/hours.
 - c. List any other facilities in the state which provide services to KP members.
 - d. What are your challenges when working with KP members and how have you been managing them?
- 4) How can a KP member be identified, approached and confirmed at a hotspot?
 - a. What dialogue, body language, and other social cues can be used to indicate intent to engage in KP behaviour of interest (transactional sex, needle sharing, or insertive/receptive anal sex among men) should enumerators look out for?
 - b. What would be an appropriate unique object for 3S-CRC?
- 5) What additional security measures should the study team plan for to ensure safety of enumerators and study participants?

7.2. Hotspot Mapping and Validation Questionnaire

7.2.1. Appendix F: Hotspot Mapping and Validation Questionnaire: FSW

State: _____ (Code); LGA: _____ Zones: _____ Spot Name: _____ Spot type: _____	Date: _____ ENU Code: _____ Spot active: <input type="checkbox"/> YES <input type="checkbox"/> NO _____ Duplicate If duplicate, which hotspot _____ Spot Geocode: Longitude _____ Latitude _____ Do you have proposed revisions to the address provided? 1. Capture 3: Enumerator: _____ Date: _____ Time In: _____ Time Out: _____		
Questions for Enumerator	Possible responses	Notes
What division, zone, and locality are you located in?	Context specific responses	This will be included if you ask your enumerators to go to specific areas only.
What is the name of the Hotspot?	1. Brothel 2. Street/public place 3. Bar/night club/casino 4. Hotel/lodge 5. Massage parlour 6. Hostel/campus 7. Escort/call girls/men 8. Drug bunk 9. others	
GPS reading of Hotspot	Longitude: _____ Latitude: _____	
1st, 2nd, or 3rd round of capture?	1.1 st round 2.2 nd round 3.3 rd round	

Number of eligible KPs found in hotspot		
Is this a count or actual estimate?	1. Actual Count 2. Estimate	
Is this hotspot a duplicate?	1. Yes 2. No	
If yes, of which hotspot ID?		If yes to 'Is this hotspot a duplicate'
Correct address		If incorrect address as currently in list
Correct spot name		If incorrect spotname as currently in list
To be filled per KP encountered		
Date and time of encounter		
Has the target population member been approached during this round of capture?	1. Yes 2. No	Yes >> End Form No >> Proceed to Next Questions
Does the individual engage in sex work (sex for gifts/ money)	1. Yes 2. No 3. Don't know 4. Refused to answer	If yes and below 18 years of age, provide with referral services
Did the target population member receive unique tag one?	1. Yes 2. No 3. Don't know 4. Refused to answer	
Do they have unique tag one?	1. Yes 2. No 3. Don't know 4. Refused to answer	
If they do not have it can they identify from page of item pictures?	1. Yes 2. No	
Where and when did they receive unique tag one?		
Did the (target population member) receive unique tag two?	1. Yes 2. No 3. Don't know	

	4. Refused to answer	
Do they have the unique tag two?	1. Yes 2. No 3. Don't know 4. Refused to answer	
If they do not have it can they identify from page of item pictures?	1. Yes 2. No	
Where and when did they receive unique tag two?		
Did the target population member accept this round of tag?	1. Yes 2. No 3. Don't know 4. Refused to answer	Yes>> Proceed to Next question No>> Document any reasons (if given)
Does the individual engage in sex work (sex for gifts/ money)	1. Yes 2. No 3. Don't know 4. Refused to answer	If yes and below 18 years of age, provide with referral services
What is the individual's LGA and state of residence?		
Do they travel to current LGA for work?	1. Yes 2. No 3. Don't know 4. Refused to answer	
Which other LGAs/ state do they travel to for work?	-----	If no other, write (N/A) If respondent refuses type "refused"
What is the person's sex at birth?	1. Female 2. Male 3. Refused	
What does the person consider their sexual orientation to be?	1. Gay or homosexual (have sex with members of the same sex only) 2. Bisexual 3. (have sex with both men and women) 4. Heterosexual or Straight (Have sex with member of the opposite sex only) 5. Other, specify: _____ 6. Refusal	

	7. Don't know	
What does the person consider their gender to be?	1. Man 2. Woman 3. Other, specify: _____ 4. Both male and female 5. Refusal 6. Don't know.	
How old is the individual?		
What is the individual's highest level of education?	1. Never attended school 2. Quranic Only 3. Primary 4. Junior Secondary/ JSS 5. Senior Secondary/ SSS 6. Higher than SSS 7. Refusal	
What is the occupation from which the individual earn most of their income? (choose one)	1. Not Working (support from someone else) 2. Pupil/Student (support from someone else) 3. Professional career 4. Self-employed business 5. Petty trading 6. Entertainment/Service/Bar/Restaurant/Hotel 7. Sex work 8. Other _____	
Are they an injecting drug user?	1. Yes 2. No 3. Don't know 4. Refused to answer	Only if individual is an MSM

7.4. Appendix J: Facility-based Capture-recapture Questionnaire

A. Per identified source

No.	Name of Source	Options	Branching Logic
1	Type of Source	1. Clinic Register 2. KP focused research study 3. Online network group 4. KP outreach programs 5. Drug treatment centre	
2	Name of Source		
3	For which of the activity states do these registers contain information on? (multiple answers allowed)	1. Akwa Ibom 2. Benue 3. Cross River 4. FCT 5. Lagos 6. Nasarawa 7. Rivers	
4	Other Notes:		
5	Which key population does this register capture? (multiple answers allowed)	1. MSM 2. FSW 3. PWID	
6	How many KPs were identified in this register?	1. MSM : _____ 2. FSW : _____ 3. PWID : _____	Only KP selected in question 5 of this form will be asked.
7	How many KPs were successfully contacted and enumerated (either through phone/physical or online)	1. MSM : _____ 2. FSW : _____ 3. PWID : _____	Only KP selected in question 5 of this form will be asked.
8	How many KPs refused participation to study?	1. MSM : _____ 2. FSW : _____ 3. PWID : _____	Only KP selected in question 5 of this form will be asked.

B. Per identified KP person from source

No.	Name of Source	Options	Branching Logic
1	Which key population does the contact belong to?	1. MSM 2. FSW 3. PWID	
2	Does the individual engage in sex work (sex for gifts/ money)	1. Yes 2. No 3. Don't know 4. Refused to answer	If yes and below 18 years of age, provide with referral services
3	Did the contact reported being approached and given a tag?	1. Yes 2. No 3. Don't know 4. Refused to answer	if YES continue to Q5 of this form if NO move to Q6 of this form
4	How many times did the contact reported being approached and accepting a tag?	1. Once 2. Twice 3. Thrice	Number of options will be as many round of captures done before for the KP group.
5	When did the contact say they received the tag?	[approximate date]	Question will be repeated according to how many

No.	Name of Source	Options	Branching Logic
			rounds specified in question 4 of this form
6	Which location did the contact received the tag? (name of Hotspot or LGA)		Question will be repeated according to how many rounds specified in question 4 of this form
7	What colour of tag item did the contact receive?	1. Pink 2. Blue 3. Red 4. White 5. Green 6. Yellow	If Q1 is "1" Phone contact Question will be repeated according to how many rounds specified in question 4 of this form
8	Provide tag code and/or other description given by the contact.	[Notes]	If Q1 is "1" Phone contact Question will be repeated according to how many rounds specified in question 4.
90	Of the pictures shown below, which is the tag the contact received?	1. [pic 1] 2. [pic 2] 3. [pic3] 4. [pic4] 5. [pic5] 6. [pic6] 7. [pic7] 8. [pic8] 9. [pic9] 10. [pic10]	If Q1 is "2" in-person contact "3" texting, or 4 "e-mail" Question will be repeated according to how many rounds specified in question 4.
10	What is the contact's LGA and state of residence?		
11	Does the contact travel to current LGA for work?	1. Yes 2. No 3. Don't know 4. Refused to answer	
12	Which other state/LGA do the contact travel to for work?		List the state/LGAs OR else type N/A
13	How old is the contact?		
14	What is the individual's highest level of education?	1. Never attended school 2. Quranic Only 3. Primary 4. Junior Secondary/ JSS 5. Senior Secondary/ SSS 6. Higher than SSS 7. Refusal	
15	What is the occupation from which the individual earn most of their income? (choose one)	1. Not Working (support from someone else) 2. Pupil/Student (support from someone else) 3. Professional career 4. Self-employed business 5. Petty trading	

No.	Name of Source	Options	Branching Logic
		6. Entertainment/Service/Bar/Restaurant/Hotel 7. Sex work 8. Other _____	
16	What is the contact's sex at birth?	1. Female 2. Male 3. Refused	
17	What does the contact consider their sexual orientation to be?	1. Gay or homosexual (have sex with members of the same sex only) 2. Bisexual 3. (have sex with both men and women) 4. Heterosexual or Straight (Have sex with member of the opposite sex only) 5. Other, specify: _____ 6. Refusal 7. Don't know	
18	What does the contact consider their gender to be:	1. Man 2. Woman 3. Other, specify: _____ 4. Both male and female 5. Refusal 6. Don't know.
