EPIDEMIOLOGIC NOTES AND REPORTS
INFLUENZA - United States

The first documented outbreak of influenza A2/Hong Kong/68 in a civilian population in the United States recently occurred in Needles, California. The outbreak involved 300 to 500 of the town's 5,000 residents, and extended over a 6-week period with the peak incidence occurring in the week of October 28-November 3. The clinical syndrome consisted of sore throat, fever, profound malaise, myalgia, and cervical adenopathy, and the illness lasted for approximately 1 to 2 weeks. Attack rates were highest in the high school population with absenteeism rates as high as 10 to 20 percent. Students in the junior high and grade schools appeared to be unaffected.

| Typhoid Fever - Cuba | 427 |

Laboratory confirmation of the outbreak included 24 convalescent sera which showed a hemagglutination-inhibition (HI) titer to A2/Hong Kong/68 influenza of greater than 1:32 in 17 specimens and a complement fixation (CF) titer to influenza A of greater than 1:32 in 13 specimens. A viral isolate with hemadsorbing properties

INFLUENZA - (*Continued from front page*)

of A2 influenza was isolated from the throat washing of one patient. Further studies to identify this virus are in progress.

Other reports of influenza activity have been received from New Jersey, Colorado, Utah, Alaska, and Illinois. In New Jersey, during the week ending November 16, an outbreak of influenza-like disease occurred in a hospital for mentally retarded individuals. Symptoms consisted of fever, cough, and coryza, and lasted for approximately 3 days. A significant difference in CF titer on a series of unpaired acute and convalescent specimens indicated influenza A infection. HI titers on these specimens provided evidence of A2 influenza infection. An isolate was obtained, and has been characterized as an A2/Hong Kong/68-like virus.

In Colorado, reported influenza-like illnesses increased from 62 cases for the week ending November 2 to 670 and 656 reported cases for the weeks ending November 9 and 16, respectively. Absenteeism rates in industries doubled in the past 2 weeks, and absenteeism rates and febrile respiratory illnesses increased in several colleges. A Denver hospital suspended all routine operations last week because of an influenza-like disease in the nursing staff.

Laboratory confirmation of influenza activity in Colorado includes a CF titer rise to influenza A from less than 1:8 to greater than 1:256 on acute and convalescent sera on two college students, and an HI titer rise to A2/Hong Kong/68 influenza from 1:20 to greater than 1:640. In addition, five viral isolates, identified as A2/Hong Kong/68-like strains, were isolated from patients in a children's hospital for asthmatics in Denver.

In Salt Lake City, Utah, A2/Hong Kong/68-like virus was isolated from a man who had onset of an influenza-like illness on November 2, the day he returned from California. Epidemiologic investigation of this case revealed secondary spread to his wife on November 9 and to a second person on November 5 who had been at a church meeting on November 3 attended by the index case. Six

other persons who worked with this second person subsequently developed an influenza-like illness and five relatives of these six cases then developed an influenza-like disease. Serologic studies on these patients are pending.

Although there had been no observed increase in absenteeism rates in schools or industries under active surveillance in Anchorage, Alaska, four isolates of A2/Hong Kong/68-like virus were obtained from patients with influenza. Seven other Alaskan communities have reported clinical evidence of influenza. These outbreaks are predominantly involving adults 20 years of age or older.

In Illinois, an influenza A2/Hong Kong/68-like virus was isolated from a student with influenza at a university student health center. Although the husband and children of the student developed similar illnesses, no other cases have been reported from the university.

(Reported by Dr. Louis F. Saylor, Director of Public Health Dr. Philip K. Condit, Chief, Bureau of Communicable Diseases, and Dr. James Chin, Epidemiologist, California State Department of Public Health; Dr. Ronald Altman, Acting Director, Division of Preventable Diseases, New Jersey State Department of Health; Dr. C. S. Mollohan, Chief, Section of Epidemiology, Colorado State Department of Public Health, Dr. Jerry J. Eller, Chief, Virology Section, US Army Medical Research and Nutrition Laboratory, Fitzsimmon General Hospital, Denver, and Dr. Elliot Ellis, Chief, Pediatrics Service, a hospital, Denver; Dr. Robert W. Sherwood, Director, Preventive Medicine, Utah Department of Health and Welfare; Elmer Feltz, Chief, Virology Unit, Arctic Health Research Laboratory, Fairbanks, and Donald K. Freedman, Director, Division of Public Health, Alaska Department of Health and Welfare; Dr. Norman J. Rose, Chief, Bureau of Epidemiology, and Richard A. Morrissey, Chief, Division of Laboratories, Illinois Department of Public Health; Respiratory Virus Infections Unit, Laboratory Program, NCDC; and EIS Officers.)

CURRENT TRENDS
INFECTIOUS SYPHILIS

National case reporting of newly acquired syphilis (primary and secondary stages) began in 1941. After 1941, case totals increased annually to an all-time peak of 110,932 cases in 1946 (Table 1). Large decreases were reported annually by all states after 1946, and in 1956, a low point of 6,392 reported primary and secondary cases was reached, a reduction of 94 percent from the 1946 total.

In 1957, however, a small increase in the national syphilis morbidity occurred, followed in succeeding years by increases of increasing magnitude. In 1960, this in-

crease over the previous year was 65 percent. After 1960, cases increased at a decreasing rate and reached a peak of 23,338 cases in 1965.

In 1966 and again in 1967, a decrease in cases occurred, and for 1968, a decrease of 8.3 percent is projected on the basis of reported cases through October (Table 2). The national decline in reported cases has not been paralleled in some reporting areas; 12 areas reported more cases during January-October 1968 than during January-October 1965, a period in which cases for the total United States declined 16.9 percent (Table 3). **1968 estimated from January-October.

half of the total increase in cases reported by these 12 areas occurred in Texas, with Indiana, Louisiana, and the District of Columbia accounting for most of the remaining increase. The increase in eight states was not significant. (Reported by the Venereal Disease Program, NCDC.)

INTERNATIONAL NOTES
TYPHOID FEVER - Cuba

An outbreak of typhoid fever occurred in eastern Cuba during August and September 1968. In the week ending August 24, 92 confirmed cases were recorded and

in the following 5 weeks approximately 67 cases per week were reported. The outbreak had subsided by the week (Continued on page 432)

TYPHOID FEVER - (Continued from page 427)

ending October 5 when only two cases were reported.¹ Most of the cases were in the cities of Bayamo and Holquin in Oriente Province (Figure 1). A physician, who had worked in two hospitals in Bayamo for 2 years prior to his arrival on October 8, 1968, in Miami, Florida, reported that the source of the epidemic was a contaminated town water supply. He reported that during the epidemic, about 90 percent of the approximately 123,000 residents in Bayamo had been immunized against typhoid fever.

Figure 1
PROVINCE IN CUBA EXPERIENCING
TYPHOID FEVER EPIDEMIC

Since approximately 900 Cuban refugees enter the United States each week, during the epidemic, the following control measures were established at the Cuban Refugee Emergency Center (CREC) in Miami: (1) a rectal swab culture was performed for each refugee arriving from Oriente Province; (2) typhoid vaccine was administered to these refugees; (3) the refugee was asked to report immediately to a physician if he became ill; and (4) the health department at the refugee's destination was notified that the person was from an area experiencing an epidemic of typhoid fever and of the medical treatment administered at the CREC. In addition, personnel at the CREC were given typhoid boosters.

As of October 10, all 600 rectal swab cultures performed at the CREC were negative for *Salmonella typhi* and no cases of typhoid fever had occurred among the refugees or their contacts within the United States. On October 15, because no cases had occurred and because arriving refugees no longer reported the epidemic, the control measures at the CREC were lifted.

(Reported by Dr. Jack McKenzie, Director, and Dr. Antonio Tagle, Assistant Director, Medical Services, Cuban Refugee Emergency Center, Miami; Dr. William R. Stinger, Acting-Director, Dr. Milton S. Saslaw, Assistant County Health Director, Disease Control, and Dr. Myriam A. Bosch, Epidemiologist, Dade County Department of Public Health; Dr. E. Charlton Prather, Director, Division of Epidemiology, and Mr. Robert A. Graves, Director, Miami Regional Laboratory, Florida State Board of Health; Medical Officer, Foreign Quarantine Program, NCDC, assigned to the Cuban Refugee Program; and an EIS Officer.)
