

**Supplementary Figure 1.** Plots showing the simple slopes for models with significant age group\*ELS interaction terms. P300 amplitudes were smaller in older vs. young adults, but only in those with lower JVQ scores (solid line; 1 *SD* below the mean). Age group did not significantly predict P300 amplitudes in participants with higher JVQ scores (dashed line; 1 *SD* above the mean). Plots created using CAHOST method (Carden et al., 2017; doi: 10.3389/fpsyg.2017.01293).
