

WEEKLY  
REPORTFor  
Week Ending  
October 6, 1973U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE  
DATE OF RELEASE: OCTOBER 12, 1973 - ATLANTA, GEORGIA 30333EPIDEMIOLOGIC NOTES AND REPORTS  
HERPES B ENCEPHALITIS - California

On April 13, 1973, a 28-year-old research assistant in California became ill with right-sided paresthesia, sore throat, and low-grade fever. On April 19, he had anorexia, stiff neck, and difficulty concentrating and moving his right fingers and was hospitalized. His temperature rose to 103°F., and on April 22, he had bladder paralysis. His electroencephalogram became diffusely abnormal, but a brain scan and a carotid arteriogram were normal. Serial spinal taps showed normal pressure, but moderate lymphocytosis and increased protein.

The patient was diagnosed as having encephalitis due to *Herpesvirus B* (*Herpesvirus simiae*, monkey B virus). By May 1, he had bilateral paralysis and a respiratory arrest, and a tracheostomy was performed. Human plasma containing *Herpesvirus B* antibody was supplied by CDC but was not administered since his condition had stabilized; he steadily improved until late June when recovery was nearly complete.

	CONTENTS
Epidemiologic Notes and Reports	
Herpes B Encephalitis - California	333
Surveillance Summary	
Smallpox - Worldwide 1973	334
International Notes	
Cholera - Algeria, Mozambique	334
Quarantine Measures	339
Current Trends	
Results of Screening for Gonorrhea - United States, 12-Month Period Ending June 30, 1973	339

No viruses could be isolated from stool, urine, throat washing, or cerebrospinal fluid specimens, but serologic tests at the California Regional Primate Research Center, Davis, California, and at the State Viral and Rickettsial Disease Laboratory confirmed the diagnosis.

The patient worked regularly with rhesus monkeys (*Macaca mulatta*) in the laboratory; 9 of the 26 monkeys to

which he was exposed were found to have *Herpesvirus B* antibody, indicative of latent infection.

(Reported by the California State Department of Health: California Morbidity, No. 37, September 21, 1973.)

#### Editorial Note

A total of 24 cases of monkey B virus infection have been reported throughout the world, half from the United States. Of the 24 patients, 23 had encephalitis, and 18 died. Of the 5 survivors, 3 had serious neurologic sequelae, 1 was expected to recover completely, and this case had a documented full recovery. Of the 17 cases for which information

is available, 14 had received a bite or scratch wound, 1 had a history of a puncture with a contaminated needle, 1 had been cut on 2 occasions by glass from monkey tissue cell culture, and 1 had no reported prior injury. The mechanism for infection in this case is unknown.

Monkey B virus is most commonly found in rhesus, cynomolgous, and bonnet macaque monkeys. These monkeys are often used in laboratories, and the rarity of this disease despite frequent human contact with infected monkeys suggests a high degree of resistance to the pathogenic effects of this virus.

#### SURVEILLANCE SUMMARY SMALLPOX — Worldwide 1973

Between January 1 and September 18, 1973, a total of 96,951 cases of smallpox were reported to the World Health Organization. This total, for the first 8 months of the year, is the highest reported since 1967, the first year of the global eradication program. All but 265 cases have been recorded by the 4 remaining endemic countries — India accounts for 58% of all cases, Bangladesh for 30%, Pakistan for 8%, and Ethiopia for 4%. However, the increase in incidence this year is almost entirely from 2 countries — India, which has so far reported 56,000 cases compared with 20,000 cases at this time last year, and Bangladesh, which has reported 29,000 cases compared with 8,000 cases by this date in 1972.

There are now 2 principal endemic areas in Asia; Sind and Baluchistan Provinces in Pakistan and Bangladesh and 4 northern states in India. Some cases of smallpox, however, have been reported from almost every part of these 3 countries. Many of the cases and outbreaks have resulted from importations from the principal epidemic areas, but the sources of most have not been properly documented.

In India, 196 of 354 districts have reported cases in 1973. Of these districts, 131 (67%) have continued to report

cases since July 1. Only in the western states of Rajasthan and Punjab and in a few states and territories of the extreme eastern wing does smallpox transmission appear to have been interrupted in this period. Similarly, in Bangladesh, all but 5 of the 56 subdivisions have recorded 1 or more cases this year, and 42 (75%) have recorded cases since July 1. In Pakistan, cases this year have been recorded by 37 of the 55 districts; 20 (54%) have detected cases since July 1.

During the period July-October smallpox incidence is usually at its lowest point of the year, and the fewest areas are involved; however, this summer the disease is still comparatively widespread.

Throughout the 3 remaining endemic countries, major campaigns are beginning to search out and eliminate remaining pockets of infection during this seasonal period of low incidence, and additional international resources are being provided to assist in this effort. However, more effective surveillance measures will be required if the autumn campaign is to be successful.

(Reported by the World Health Organization: Weekly Epidemiological Record, Vol. 48, No. 38, September 21, 1973.)

#### INTERNATIONAL NOTES CHOLERA — Algeria, Mozambique

##### Algeria

On September 28, 1973, 39 cases of cholera were reported from the Wilayas of Aures, El Asnam, Mostaganem, Oran, and Tlemcen. All necessary control measures including extensive health education activities have been implemented. Selective vaccination has been carried out on the basis of epidemiologic studies in areas of high risk.

##### Mozambique

A report was received on October 1 confirming the

presence of 15 cases of cholera and 1 death in the Beira Health Delegation of the Manica and Sofala District. This is the first official notification of the presence of cholera in Mozambique in this pandemic. No details have yet been received concerning the biotype or serotype of the vibrio isolated.

(Reported by the World Health Organization: Weekly Epidemiological Record, Vol. 48, No. 40, October 5, 1973.)

**CURRENT TRENDS**  
**RESULTS OF SCREENING FOR GONORRHEA —**  
**United States, 12-Month Period Ending June 30, 1973**

In the 12-month period ending June 30, 1973, gonorrhea screening programs cultured specimens from 4,939,592 females; 242,276 (4.9%) were positive. Table I reflects the results of such screening by type of health care facility securing the specimen. Although the positivity rates were highest (18.9%) in venereal disease clinics, only 12% of all tests were performed at such clinics. Some 88% of all tests were performed in settings other than venereal disease clinics, and in these, positivity rates ranged from 1.0% among females

tested at industrial screening facilities to 7.6% among enrollees in manpower training programs. Some 1,133,785 females were tested by private physicians, and 25,816 (2.3%) were positive. Preliminary data indicate that 1,203,291 females were tested by all types of facilities in July and August 1973 or about 600,000 per month. The overall positivity rate for all sources for this period was 4.7%.

(Reported by the Venereal Disease Branch, Bureau of State Services, CDC.)

The Morbidity and Mortality Weekly Report, circulation 36,000, is published by the Center for Disease Control, Atlanta, Ga.

Director, Center for Disease Control  
 Director, Bureau of Epidemiology, CDC  
 Editor, MMWR  
 Managing Editor, MMWR

David J. Sencer, M.D.  
 Philip S. Brachman, M.D.  
 Michael B. Gregg, M.D.  
 Deborah L. Jones, B.S.

The data in this report are provisional, based on weekly telegraphs to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday.

In addition to the established procedures for reporting morbidity and mortality, the editor welcomes accounts of interesting outbreaks or case investigations of current interest to health officials.
