There is high prevalence of work related musculoskeletal disorders (MSDs) in the winegrape industry. Manual pruning of dormant vines and harvesting are highly repetitive and physically demanding jobs that are expected to expose workers to an increased risk for MSDs. The purpose of this study is to quantify risk factors associated with the development of musculoskeletal injuries to the wrist and lower back while pruning and harvesting five commonly used winegrape trellis systems. Twenty three subjects participated in two separate pruning and harvesting simulations. Subjects performed either a simulated pruning or harvesting task as wrist and trunk postures data were gathered. The results revealed significant differences among the trellis systems. Compared to the other systems, the vertical shoot positioned (VSP) was determined to be most optimal in terms of decreasing relative MSD risk, for both pruning and harvesting.

### INTRODUCTION

It has been well known that the agriculture industry is one of the Nation's most hazardous industries (Meyers, 1999). The most commonly reported injuries within the California agriculture were musculoskeletal disorders (MSDs) (Villarejo, 1999). In the winegrape industry alone, a work related MSD incidence rate of 80 per 1000 workers (Meyers, 2000) was reported. The most commonly recorded injuries were attributed to MSDs of the lower back and the upper extremities.

Manual pruning of dormant vines, among the various procedures involved in the production of wine, is one of the most expensive and labor consuming, and is exceeded in both respects only by the harvest process (Tassie, 1992).

trellis system with regards to minimizir to the employee.

### Subjects

Twenty three healthy subjects (22 r each with pruning and harvesting exper this study. Pruning experience across st 5-15 years. The mean age was 39 years mean stature was 169.5 cm (10.1 std. d were screened with regard to any currel of the back and upper extremities.

### Apparatus

Field visits have shown on average that typical pruning work shifts are 8 hours, at a rate of approximately 40 cuts per minute. The major tasks involved in manual harvesting of winegrape consist of cutting grapes (at a rate of 25-50 cuts per minute) from the vine and dropping them into a tub, and carrying the filled tub to be emptied into trailer-mounted bins for transport (each worker performs about 150-200 tubs per day).

The design characteristics of the vine trellis system vary significantly (Dokoozlian, 2000). These differences are expected to result in differences in workers exposure to MSD risk. Finding a trellis system that minimizes MSD risk factors would be beneficial in reducing the prevalence of MSDs in the winegrape industry. Therefore, the objectives of this study is to quantitatively evaluate five commonly used trellis systems throughout the Northern California winegrape vineyard industry. This evaluation will be based on the relative risks of developing MSDs to the wrist and the lower back while pruning. It is hoped that the results of this study will assist vineyard proprietors to select an optimal

Five simulation trellis systems were study: Lyre, Scott Henry, Smart Dyson. The cutting heights were based on average standards and are as follows: 61.0 cm-Smart Henry, 99.1 cm-Smart Dyson, 101.0 cm-Lyre. The row length for all trellis systems is approximately 9.1 m. To simulate the previously cut (pruned) vine branches Styrofoam blocks at the appropriate height. The task was simulated using 1-lb bags or rice bags on vine wires at the appropriate cutting height.

The Motion Analysis System (MAS) (Motion Systems, Palo Alto, CA) and the Biomechanical Motion Analysis System (Biometrics Ltd., UK) were used to collect position and kinematic data of the wrist flexion/extension and radial/ulnar plane during harvesting, respectively.

The Lumbar Motion Monitor (LMM) (Hixon, TN) was used to track the motion in the three principal anatomical planes (sagittal

coronal). Figure 1 shows a subject equipped with the LMM and MAS while performing a pruning trial, and Figure 2 shows a subject performing a harvesting trial during harvesting, on one of the simulated trellis systems.

**Figure 1.** A subject performs a pruning trial on a simulation trellis.

simulation, each subject was instructed to perform a row per trellis system and to perform the task as they would normally. Similarly, during harvesting simulation the subjects were asked to cut clusters (rice bags) of half a row, and place them on the ground.

### Analysis

Frequency distributions centered on the wrists and trunk in each respective plane were created. The percent of time spent within each posture was established for each principal plane. Posture specific ranges of the wrist were established using the software. The ranges for the wrist flexion/extension ( $\theta$ ) are defined as follows:

$$1 = \theta \leq -15^\circ; 2 = -15^\circ < \theta < 15^\circ; 3 = 15^\circ \leq \theta < 30^\circ$$

The posture specific ranges of the trunk were established by Fathallah et al.

ranges for the trunk sagittal plane are defined as:

$$1 = \theta < 0^\circ; 2 = 0^\circ \leq \theta < 15^\circ; 3 = 15^\circ \leq \theta < 30^\circ; \text{ and } 4 = 30^\circ \leq \theta$$

Analyses of variances (ANOVAs) were used to determine statistical differences among the trellis systems.

**RESULTS AND DISCUSSION**

Figures 3 and 4 show the average percent of time spent during pruning within the specified ranges of wrist flexion/extension of the left wrist and trunk flexion/extension in the sagittal plane, respectively. ANOVAs were used to compare the average percent of time within each range (i.e., range 1) among all trellis systems. From Figure 3, significance was noticed for the flexion/extension of the left hand for ranges 1 and 2. The VSP 4x4 resulted in the lowest percent of time in the neutral range (range 2) with an average of 35.1%. The VSP 4x4 also resulted in the highest percent of time in extreme extension (range 4) of 42.1%. The large percent of time in extreme extension for the VSP suggests that the left hand is in extreme extension for at least 50% of the time.

The VSP 4x4 (left wrist) resulted in the highest percent of time in extreme extension (range 4) of 42.1% compared with the other systems. The VSP 4x4 was the most prevalent range for the VSP 4x4 was range 4 with an average of 35.1%. Therefore, 75% of the time was spent in extension postures exceeding 15 degrees.

Results from the flexion/extension of the trunk during harvesting demonstrated that the percentage spent in semi-neutral posture (range 2) was the highest (Figure 5).

**Figure 2.** A subject performs a harvesting trial on a simulation trellis.

**Design**

The study consisted of two one-way within-subject designs (one for pruning, one for harvesting) with five levels (trellis systems, discussed above). Several dependent variables were collected in this study. However, this paper focuses on the percent of time spent in specified ranges of the wrist (flexion/extension) and trunk (sagittal plane). The pruning and harvesting order for the trellis systems was randomly presented across all subjects.

**Procedure**

Each subject agreed to participate in the study and signed an informed consent form. For both simulations, data were collected on two subjects per day. Baseline readings from the LMM and MAS/Biometrics systems were collected for each subject prior to data collection. During the pruning

 80%  
 70%

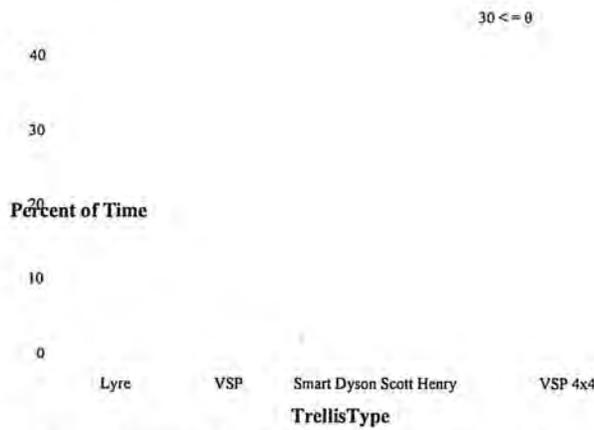

Figure 3. Percent of time spent in flexion/extension of the left wrist during pruning.

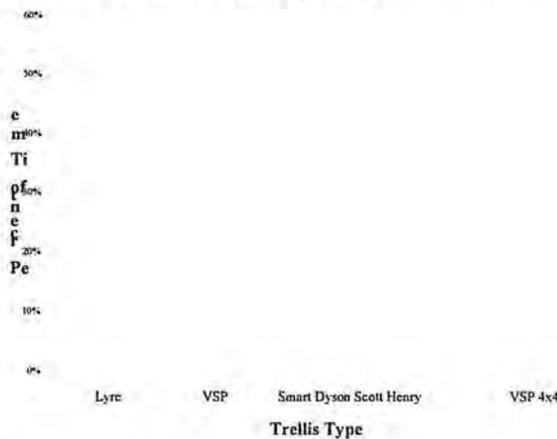

Figure 4. Percent of time spent in flexion/extension of the right wrist during harvesting.

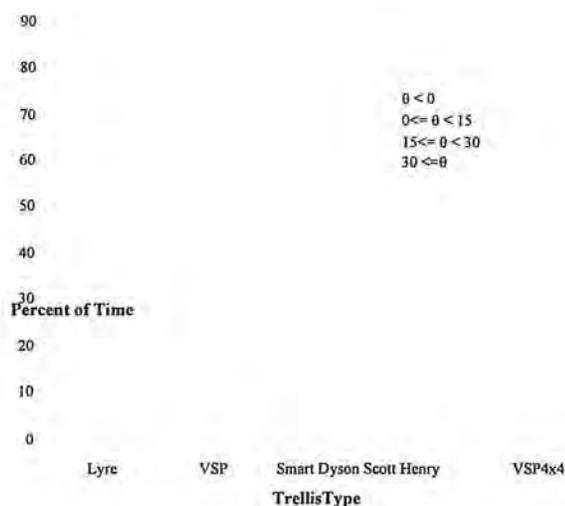

Figure 5. Percent of time spent in the sagittal plane during pruning.

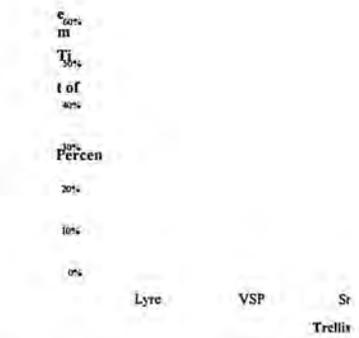

Figure 6. Percent of time spent in different trunk flexion ranges during harvesting.

From Figure 5, the Lyre system during pruning resulted in the largest percent of time spent in the neutral range (range 2) compared with the other systems. The percent of time spent in extension (range 1) was 6.1% for the Scott Henry, which resulted in the highest percentage. Similar trends were observed during harvesting (Figure 6). The extension of the trunk is harmful to the posterior elements of the spine (Adams et al., 2000). In addition, much of the pruning was performed with the arms above the shoulder posture assumed was similar to that of a person working above the shoulders, causing extension of the trunk (Adams et al., 1999) defined occupational tasks that require the hand position above the acromion as harmful to the shoulder. This hand position causes impingement of the rotator cuff structures leading to MSDs of the soft tissue of the shoulder. Therefore, the Lyre trellis system is an ideal choice.

The VSP resulted in the largest percent of time spent in the neutral range (range 2) during pruning of 73.2%. In contrast, the VSP 4x4 resulted in the lowest percent of time spent in range 2 of 4.5%. Excluding the Lyre, a downward trend was observed for the percent of time spent in range 2 as the cutting height decreased. This clearly showed the direct relationship between trunk flexion and cutting height. As the cutting height decreased, the amount of time spent in the neutral range decreased as flexion of the trunk was required to accommodate the lower cutting height. Similar trends were observed during harvesting.

During both pruning and harvesting, the Lyre system resulted in the largest percent of time spent in trunk flexion angles that exceeded 30 degrees. This was significantly higher for the VSP 4x4 compared to other systems. The VSP 4x4 averaged 8.5% of time in that range compared to less than 5% for the other systems during pruning and harvesting, and

The Lyre and VSP 4x4, both of which encompass relatively extreme trunk postures, result in the largest wrist flexion angles compared with the other trellises. Therefore, the implication from this result emphasizes the interaction effect of risk factors. The relatively large trunk flexion and extension angles in combination with increased wrist flexion increase the risk of developing MSDs of both the wrist and the back. The increased trunk flexion and increased wrist flexion angles make the VSP 4x4 system the least desirable from a MSD risk standpoint. The Lyre system would also be undesirable due to the combination of increased trunk extension, increased wrist flexion and shoulder increased abduction angles (observed during the experiment).

#### CONCLUSION

This study was able to demonstrate the relative risk of developing MSDs during pruning and harvesting among five of the common trellis systems used in the winegrape industry. The significance of these findings may have important implications to vineyards that are currently considering to plant or re-plant new vines. On average, the VSP system showed the lowest levels of risk to the wrist and the back during both pruning and harvesting. Hence, the use of this system should be advocated especially if there are no substantial differences with respect to grape quality or vine productivity among the variety of trellis systems.

There is high prevalence of work related musculoskeletal disorders (MSDs) in the winegrape industry. Manual pruning of dormant vines and harvesting are highly repetitive and physically demanding jobs that are expected to expose workers to an increased risk for MSDs. The purpose of this study is to quantify risk factors associated with the development of musculoskeletal injuries to the wrist and lower back while pruning and harvesting five commonly used winegrape trellis systems. Twenty three subjects participated in two separate pruning and harvesting simulations. Subjects performed either a simulated pruning or harvesting task as wrist and trunk postures data were gathered. The results revealed significant differences among the trellis systems. Compared to the other systems, the vertical shoot positioned (VSP) was determined to be most optimal in terms of decreasing relative MSD risk, for both pruning and harvesting.

### **INTRODUCTION**

It has been well known that the agriculture industry is one of the Nation's most hazardous industries (Meyers, 1999). The most commonly reported injuries within the California agriculture were musculoskeletal disorders (MSDs) (Villarejo, 1999). In the winegrape industry alone, a work related MSD incidence rate of 80 per 1000 workers (Meyers, 2000) was reported. The most commonly recorded injuries were attributed to MSDs of the lower back and the upper extremities.

Manual pruning of dormant vines, among the various procedures involved in the production of wine, is one of the most expensive and labor consuming, and is exceeded in both respects only by the harvest process (Tassie, 1992). Field visits have shown on average that typical pruning work shifts are 8 hours, at a rate of approximately 40 cuts per minute. The major tasks involved in manual harvesting of winegrape consist of cutting grapes (at a rate of 25-50 cuts per minute) from the vine and dropping them into a tub, and carrying the filled tub to be emptied into trailer-mounted bins for transport (each worker performs about 150-200 tubs per day).

The design characteristics of the vine trellis system vary significantly (Dokoozlian, 2000). These differences are expected to result in differences in workers exposure to MSD risk. Finding a trellis system that minimizes MSD risk factors would be beneficial in reducing the prevalence of MSDs in the winegrape industry. Therefore, the objectives of this study is to quantitatively evaluate five commonly used trellis systems throughout the Northern California winegrape vineyard industry. This evaluation will be based on the relative risks of developing MSDs to the wrist and the lower back while pruning. It is hoped that the results of this study will assist vineyard proprietors to select an optimal trellis system with regards to minimizing MSD risk exposure to the employee.

### **Subjects**

Twenty three healthy subjects (22 males and 1 female) each with pruning and harvesting experience participated in this study. Pruning experience across subjects ranged from 5-15 years. The mean age was 39 years (10.3 std. dev.), and mean stature was 169.5 cm (10.1 std. dev.). All subjects were screened with regard to any current or previous MSD

of the back and upper extremities.

#### **Apparatus**

Five simulation trellis systems were constructed for this study: Lyre, Scott Henry, Smart Dyson, VSP 4x4 and VSP. The cutting heights were based on average vineyard standards and are as follows: 61.0 cm-VSP 4x4, 86.4 cm-Scott Henry, 99.1 cm-Smart Dyson, 106.7 cm-VSP and 122 cm-Lyre. The row length for all trellis systems was approximately 9.1 m. To simulate the pruning task, previously cut (pruned) vine branches were inserted into Styrofoam blocks at the appropriate height. The harvesting task was simulated using 1-lb bags or rice attached to the vine wires at the appropriate cutting height.

The Motion Analysis System (MAS) (Greenleaf Medical Systems, Palo Alto, CA) and the Biometrics wrist goniometers (Biometrics Ltd., UK) were used to capture position and kinematic data of the wrist in the flexion/extension and radial/ulnar planes during pruning and harvesting, respectively.

The Lumbar Motion Monitor (LMM) (Chattecx Corp., Hixon, TN) was used to track the motion of the trunk in the three principal anatomical planes (sagittal, transverse and

coronal). Figure 1 shows a subject equipped with the LMM and MAS while performing a pruning trial, and Figure 2 during harvesting, on one of the simulated trellis systems.

**Figure 1.** A subject performs a pruning trial on a simulation trellis.

**Figure 2.** A subject performs a harvesting trial on a simulation trellis.

#### **Design**

The study consisted of two one-way within-subject designs (one for pruning, one for harvesting) with five levels (trellis systems, discussed above). Several dependent variables were collected in this study. However, this paper focuses on the percent of time spent in specified ranges of the wrist (flexion/extension) and trunk (sagittal plane). The pruning and harvesting order for the trellis systems was randomly presented across all subjects.

#### **Procedure**

Each subject agreed to participate in the study and signed an informed consent form. For both simulations, data were collected on two subjects per day. Baseline readings from the LMM and MAS/Biometrics systems were collected for each subject prior to data collection. During the pruning simulation, each subject was instructed to prune half of each row per trellis system and to perform the pruning task as they would normally. Similarly, during the harvesting simulation the subjects were asked to cut the simulated grape clusters (rice bags) of half a row, and place those into bins placed on the ground.

#### **Analysis**

Frequency distributions centered on ranges of motion for the wrists and trunk in each respective plane of motion were created. The percent of time spent within a specified range was established for each principal plane of motion. The posture specific ranges of the wrist were based on the MAS software. The ranges for the wrist flexion/extension angle ( $\theta$ ) are defined as follows:

$$1 = \theta \leq -15$$

$\theta$   
 ; 2 = -15  
 $\theta$   
 $< \theta < 15$   
 $\theta$   
 ; 3 = 15  
 $\theta$   
 $\leq \theta < 30$   
 $\theta$   
 ; and 4 =  
 30  
 $\theta$   
 $\leq \theta$

The posture specific ranges of the trunk were based on parameters established by Fathallah et al. (1998). The ranges for the trunk sagittal plane are defined as follows:

1 =  $\theta < 0$   
 $\theta$   
 ; 2 = 0  
 $\theta$   
 $\leq \theta < 15$   
 $\theta$   
 ; 3 = 15  
 $\theta$   
 $\leq \theta < 30$   
 $\theta$   
 ;  
 and 4 = 30  
 $\theta$   
 $\leq \theta$

Analyses of variances (ANOVAs) were performed to determine statistical differences among the trellis systems.

### RESULTS AND DISCUSSION

Figures 3 and 4 show the average percent of time spent during pruning within the specified ranges for the flexion/extension of the left wrist and trunk position in the sagittal plane, respectively. ANOVAs were completed to compare the average percent of time within a specific range (i.e., range 1) among all trellis systems during pruning.

From Figure 3, significance was noticed for the flexion/extension of the left hand for ranges 2 and 4 only.

The VSP 4x4 resulted in the lowest percent of time spent in the neutral range (range 2) with an average of 13.7%. The VSP resulted in the highest percent of time with an average of 51.2% in this range. The large percentage observed for the VSP suggests that the left hand is within a neutral range for at least 50% of the time.

The VSP 4x4 (left wrist) resulted in the highest percent of time in extreme extension (range 4) with an average of 42.1% compared with the other systems. The second prevalent range for the VSP 4x4 was range 3 with an average of 35.1%. Therefore, 75% of total pruning time is spent in extension postures exceeding 15

for the VSP 4x4.

Results from the flexion/extension of the right wrist during harvesting demonstrated that the VSP had the highest percentage spent in semi-neutral postures (-15 to 15 degrees) (Figure 5).

 Time

**Figure 6.** Percent of time spent in the sagittal plane during harvesting.

From Figure 5, the Lyre system during pruning resulted in the largest percent of time spent in sagittal extension compared with the other systems. The average percent of time spent in extension (range 1) was 67.3% compared with 17.1% for the Scott Henry, which resulted in the second highest percentage. Similar trends were observed during harvesting (Figure 6). The extension of the trunk may be harmful to the posterior elements of the lumbar spine (Adams et al., 2000). In addition, much of the cutting was performed with the arms above the shoulder. The body posture assumed was similar to that of reaching for an object above the shoulders, causing extension of the trunk. Frost et al. (1999) defined occupational tasks that position the hands above the acromion as harmful to the shoulder. The elevated hand position causes impingement of the subacromial structures leading to MSDs of the soft tissues that comprise the shoulder. Therefore, the Lyre trellis would not be an ideal choice.

The VSP resulted in the largest percent of time spent in the neutral range (range 2) during pruning with an average of 73.2%. In contrast, the VSP 4x4 resulted with an average of 4.5%. Excluding the Lyre, a downward trend was noticed for the percent of time spent in range 2 as cutting height decreased. This clearly showed the direct relationship between trunk flexion and cutting height. As cutting height decreased, the amount of time spent in neutral postures decreased as flexion of the trunk was increased to accommodate the lower cutting height. Again, similar trends were observed during harvesting (Figure 6). During both pruning and harvesting, the percent of time spent in trunk flexion angles that exceeded 30

were significantly higher for the VSP 4x4 compared with the

other systems. The VSP 4x4 averaged 81% of the time in that range compared to less than 5% and 30% for the VSP system during pruning and harvesting, respectively.

The Lyre and VSP 4x4, both of which encompass relatively extreme trunk postures, result in the largest wrist flexion angles compared with the other trellises. Therefore, the implication from this result emphasizes the interaction effect of risk factors. The relatively large trunk flexion and extension angles in combination with increased wrist flexion increase the risk of developing MSDs of both the wrist and the back. The increased trunk flexion and increased wrist flexion angles make the VSP 4x4 system the least desirable from a MSD risk standpoint. The Lyre system would also be undesirable due to the combination of increased trunk extension, increased wrist flexion and shoulder increased abduction angles (observed during the experiment).

**CONCLUSION**

This study was able to demonstrate the relative risk of developing MSDs during pruning and harvesting among five of the common trellis systems used in the winegrape industry. The significance of these findings may have important implications to vineyards that are currently considering to plant or re-plant new vines. On average, the VSP system showed the lowest levels of risk to the wrist and the back during both pruning and harvesting. Hence, the use of this system should be advocated especially if there are no substantial differences with respect to grape quality or vine productivity among the variety of trellis systems.

Why Does It Seem So Difficult to Make Computers Friendly?  
Tom Stewart 16

e-Life in Korea: Ergonomic Issues  
Nahm S. Lee 20

#### PLENARY SESSION II B

*Chair: Sheng Wang, Beijing University*

Human-Centered Design Using Human Design Technology - Applications to Universal Design and so on  
Toshiki Yamaoka 21

Musculoskeletal Disorders in the Digital Age: The Office Environment and Computer Workstation  
Andris Freivalds 25

#### PLENARY SESSION III A

*Chair: Gary A. Mirka, North Carolina State University*

The Future of Research in Understanding and Controlling Work-Related Low Back Disorders William S. Marras	30
Enhancing the Impact of Ergonomic Interventions Ernst A.P. Koningsveld, Jan Dul, Gu W. van Rhijn, and Peter Vink	33
<b>PLENARY SESSION III B</b>	
<i>Chair: Masaharu Kumashiro, University of Occupational and Environmental Health</i>	
From Industrial Safety to Corporate Health Management Klaus J. Zink	37
Quantitative Assessment for the Whole Body Postural Load Min K. Chung	41
<b>PLENARY SESSION IV A</b>	
<i>Chair: H.A.M. Dannen, TNO Human Factors</i>	
Ergonomics Support for Local Initiative in Improving Safety and Health at Work - ILO Experiences in Industrially Developing Countries Tsuyoshi Kawakami	45
<b>PLENARY SESSION IV B</b>	
<i>Chair: Eric Wang, Tsing Hua University</i>	
Ergonomics in TQM: How Can We Sell Ergonomics to Management? Kwan S. Lee	49
Attention - Neuroergonomics Point of View Tadeusz Marek	53
<b>🌐 COGNITIVE ERGONOMICS</b>	
<b>COGNITIVE ERGONOMICS I</b>	
Comparison of Information Requirements from Task- and System-Based Work Analyses Greg A. Jamieson	57
Utilizing Cognitive Feedback to Support Human Operators' Judgment Performance with Fusion Based Decision Aids Younho-Seong and Ann M. Bisantz	61
Initiating Person-Oriented Business Engineering Processes in a Collaborative Environment Klaus-Dieter-Froehner and Jurgen Zabel	65
A Study on Cognitive Characteristics of Children' s Information Architecture Using Participatory Design Technique Joon-Sang Baek and Kun-Pyo Lee	69
Development of a Questionnaire to Quantify Hall' s Notion of Time Orientation Tom Plocher, Chen Zhao, Yifei Xu, Zhang Kan, and Max Liang	73
A Study on the Relationship between Short-Term Memory Effect and the Variation of the Cognitive Map Seung Dong Yu and Peom Park	76
<b>COGNITIVE ERGONOMICS II</b>	

The Research and Design of More Legible and Readable Key Legends for School Children while Operating Chinese Computer Keyboard Jen-Cheng Chen and Hsin-Hsi Lai	80
Effect of Mobile Phones and Other Mobile Equipment on Time Management Marika Keskinen, Noomi Laakkonen, and Leena Korpinen	84
A Robust Color Segmentation Technique for Tangible Space Chi-Ho Kim, Bum-Jae You, Hagbae Kim, and Sang-Rok Oh	88
Effects of Experience on Users' Assumptions about Operating Procedures for Electric Appliances Mamoru Okada, Akio Ishimoto, Takuo Matsunobe and Toshiaki Yamaoka	92
A Cognitive Ergonomics Approach to the Process of Game Design and Development Yves Grassioulet	96
Evaluation of Motion Sickness Caused by Videogames Keiji Ohta, Takashi Kawai, Yoshimitsu Ebine, Takashi Shoji, Akihiro Etori, Takuji Konuma, and Koichi Murayama	100
<b>COGNITIVE ERGONOMICS III</b>	
Training Situation Awareness for Improved Performance Laura D. Strater and Mica R. Endsley.	104
A Study of Relationship between the Icons' Arrangement on the Screen and Visual Search Takayuki Hayashi, Daiji Kobayashi, and Sakae Yamamoto	108
Temporal Control Mechanism in Equal Interval Tapping with and without Metronome Ticking Masashi Yamada	111
The Impact of Training and Individual Differences in Style on Visual Discrimination Performance Elizabeth A. Kramer, James H. Pratt, and Young Woo Sohn	115
Evaluation of a TV Program for Infants Using Image Processing Takashi Kawai, Shigekazu Sakai, Yoshie Takahashi, Hiroshi Hattori, and Nobuo Isshiki	119
<b>COGNITIVE ERGONOMICS IV</b>	
Verbal Comprehension and Speech Production during Simulated Driving Xianghong Sun and Kan Zhang	123
Driving Performance Difference for Drivers' Attention Switch Requirements Using Head-Up Display in Automobile Yung-Ching Liu	127
Effects of Wireless Communication on Driving Performance Using a Desktop Driving Simulator Chih-hsiang Joe Chen and Chih-hsiang Joe Lin	131
Effects on a Driver's Cognition by Pollinosis Takashi Ikeda, Daiji Kobayashi, and Sakae Yamamoto	135
Restoring Depth Perception to Remote Crane Operators: An Assessment of the Efficacy of a 3D Stereoscopic Display System Siew Ming Quek and Kee Yong Lim	137
Informing Limit of Ability and Its Reason for Reducing Overtrust in Automation Makoto Itoh, Hiromasa Inahashi, and Kenji Tanaka	141
<b>LEARNING IN INTERACTIVE CONTEXTS</b>	
<i>Organizer: Gabriella Caterina</i>	
School and ICT Roles, Interactions, Interfaces Ivetta Ivaldi	145

School Interactive Workstation for the Improvement of Children's Learning Performances Gabriella Caterina	148
Effects on Learning Performances of Emotional and Affective Components: Human Factor Affective Design Contribution Erminia Attaianese	152
The On Line Forum on Learning in Interactive Contexts: Highlight on Main Contributions Gabriella Duca	156

## ● **COMPUTER AND COMMUNICATION**

### **COMPUTER AND COMMUNICATION**

Towards Co-operative Process Control: Challenges for Computer Mediated Knowledge Support Toni K.S. Koskinen	160
The Effects of Computerized Agendas and Time Structuring on Small Group Decision Making Makiko Ikeda and Ann M. Bisantz	164
A Study of an Information Share-able Board for Remote Cooperative Work Suemitsu Hideyuki, Sakae Yamamoto, and Daiji Kobayashi	168
Automation-State Changes and Sensory Cueing in Telerobot Control David B.Kaber and Melanie C. Wright	170
An Information Access Mechanism for A Context-Aware System by Situated Interaction in Ubiquitous Computing Environment like Museum Kiwon Yeom and Ji-Hyung Park	174
Effects of Automation on Teamwork Melanie C.Wright and David B. Kaber	178

## ● **e-BUSINESS AND WEB APPLICATION**

### **e-BUSINESS AND WEB APPLICATIONS I**

Information Structure of Mobile Internet Min Hee Chae and Jin Woo Kim	182
Ergonetti - University - Level Studies of Basic Ergonomics through the Internet Veikko A. Louhevaara, T. Saaranen, U. Ritvanen, H. Toivanen, A. Paakkonen, and A. Ropponen	186
Task-Interface Matching: How We May Design User Interfaces Wan Chul Yoon	190
An Ecological Study of Elderly People Learning the Internet: Cognitive Processes and Effect of Utility, Usability and Expertise Cecilia De la Garza and Jean Marie Burkhardt	194
A Multi-level Case-based Design Aid for User Interface Designers Huhn Kim and Wan Chul Yoon	199
Verification of a B2C Consumer Behavior Model in Electronic Commerce Hui-Ming Kuo, Eric Min-yang Wang, and Sheue-Ling Hwang	203

**e-BUSINESS AND WEB APPLICATIONS II**

Development of Tool for Remote Usability Testing for Web Site Ki Tae Oh and Kun Pyo Lee	207
Comparative Choices During Product Design in Mass Customization Web Sites Ameersing Luximon, Alla Khosrovyan, and Hayk Mesropyan	211
The Effects of Culture on Interface Structure and Navigation of Website -With the Emphasis on Cross-Cultural Usability Testing Jung ha Kim and Kun Pyo Lee	215
Website Usability: Remote Versus Direct Testing Wai-Cheong Liew and Ram R. Bishu	219
E-learning and E-government in Thai Public Sector Toni Ivergard, Brian Hunt, and Michita Champathes Rodsutti	223
Effects of the Types of Website and Task on the Navigation Methods So Young Kim, Kun Pyo Lee, and Chang Young Lim	227

**● HCI & USABILITY****HCI & USABILITY I**

Usability Challenges for Multinational Companies Abbas Moallem	232
Scenarios for Usability Evaluation: Using Design Information Framework, and a Task Analysis Approach Youn-kyung Lim and Keiichi Sato	236
Experimental Analysis of Multi-media and Multi-modal Cognitive Characteristics and Its Problems Fumio Wada, Shun'ichi Tano, and Mitsuru Iwata	240
Design of an Adaptive User Interface Based on Action Prediction Alexander Kuenzer and Holger Luczak	244
Formal Top-Down Analysis of Interface Design May Improve Usability Shuan Lo, Martin G. Helander, and Roger J. Jiao	248
"Verbalyse": Evaluation Programme for Natural Man-Machine Interfaces Laurent Joblet and Pierre-Henri Dejean	252

**HCI & USABILITY II**

Computer Mouse Location Affects Upper Extremity Posture, EMG, and Force Jack Dennerlein, Erik Won, Lope Barrero, Ted Becker, Jennifer Ibbotson, and Peter Johnson	259
Virtual Evaluation Of Cognitive Support For Human-Machine Interfaces Seockhoon Bae, Calvin J. Hur and Donghyuk Choi.	263
Usability of Gaze Interaction Compared to Mouse and Head-Tracking in Typing Japanese Texts on a Restricted On-Screen Keyboard for Disabled People Hirotaka Aoki, Kenji Itoh, Norimasa Sumitomo, and John Paulin Hansen	267
The Usability of User Manuals Martin Bocker and Lutz Groh	271
New Data Logging Software Effectively Implement Observation Records for Usability Testing<Demonstration> YI Qiang, Satoshi Sakuragawa, Taka-aki Suzuki, Hisae Tamura, and Masaaki Kurosu	275

**HCI & USABILITY III**

A Proposed Taxonomy for Describing Computer Input Device Usage Jack T. Dennerlein, Antonio Chemor-Ruiz, Peter Johnson, and Carolyn Sommerich	279
Enhancing Webpad' s Interface Usability with Human Factors Considerations Chien-Hsiung Chen, Hong-Tien Wang, Chiao-Tsu Chiang, Yueh-Chi Wang, and Hung-Liang Hsu	283
Usability and Characteristics of Mobile Phones for Elderly People Masaru Miyao, Masako Omori, and Tomoyuki Watanabe	287
Hand Support in the Design of Computer Mouse Design: Evaluation of Performance and Users' Perceived Comfort and Preference Hugh McLoone and Peter Johnson	291
The Effects of the PC Experience on the Usability of PDAS Sang-Hoon Jeong and Kun-Pyo Lee	295
Designing a Wireless Signal Strength Test Analyzer with Contextual Usability Analysis - A Case Study Hong-Tien Wang, Chieh-Yu Chan, Shih-Chieh Chen, and Hung-Liang Hsu	300

**HCI & USABILITY IV**

A Study on the Improvement of Usability in the Home Network System Kyung S. Park, Jae In Lee, Il Haeng Cho, and Un H. Kim	304
LIVEFUTURA -User Centred Design for Smart Homes Frank Heidmann, Elizabeth Hofvenschild, and Brigitte Ringbauer	308
A Data Mining Approach to Obtaining User-Required Information for a Smart House Application Jiyoung Kwahk, Robert C. Williges, and Tonya L. Smith-Jackson	312
Usability of Personalized Web Site Rui-feng Yu and Alan H. S. Chan	316
Human Computer Interface Design for Monitoring and Controlling Manufacturing Processes: A Case Study for a Steel Manufacturing Company Huichul Yang, Sung H. Han, and Dong-Gwan Im	320
A Study on the User Interface Consulting Process of Online Stock Trading System(OSTS) Soojin Baek, Yong Kwon, Rick Lee, Suhee Choi, Taesung Park, and Jungwook Huh	324

**HCI & USABILITY V**

Usability of Operating Systems (OS) Icons Ameersing Luximon, Anush Ghambaryan and Artavazd Mehrabyan	328
Ergonomic Improvements on Icons, and Graphical User Interface (GUI) in Different Computer Operating Systems Being Used in Malaysia Rabindra Nath Sen and Ifarn Chen	332
Terms and Icons in Small Display User Interface Lauri Repokari	336
Optimal Design of Progress Bar that will Satisfy the User Masaaki Kurosu	340
Evaluation of UISB - The User Interface Specification Browser Marko H. T. Nieminen, Mikael Johnson, Jarmo Parkkinen, and Toni Koskinen	344
The Operation Behavior and Its Effect of Doing Freehand Sketches with the Pressure Sensitive Pen and the Graphic Tablet Wen-Dih Yeh, Chang-Hsien Chu, and Tsung-Kai Cheng	348

**HCI & USABILITY VI**

Development of Human Navigation System "HapticNavi" Using Gyrocube Norio Nakamura and Yukio Fukui	352
In-Vehicle Navigation Information Display: Integration of Visual and Auditory Presentation Xianghong Sun and Kan Zhang	354
Design and Development of a Radically Revised En-Route Air Traffic Control System Hugh David	358
Temporal Navigation Aids for Video Content Broadcast through Digital TV Hyunho Kim, Kyungwook Park, and Jinwoo Kim	362
Two Evaluations of a Radically Revised ATC Interface Hugh David and J.M. Christian Bastien	366
Creating Interactive Experiences : Experimental Study on Interactive Media Design for Children Tae-il Lee	370

**HCI & USABILITY VII**

Usability Challenges in Ubicomp Environment Shang-hwan Kim, Sung Woo Kim, and Hyun-mi Park	374
Effects of Display Medium and Luminance Contrast on Memory Performance and Physiological Response (EEG) Mei-Hsiang Chen, Kong-King Shieh, and Ya-Huei Wang	378
Biometrics-based Password Identity Verification :Some Practical Issues and Solutions Enzhe Yu and Sungzoon Cho	384
User Evaluation of Voice User Interface for Mobile Internet Service Sujin Kim, Jayung Lee, Daeyurl Na, and Eun-Ah Kim	388

**USABILITY STANDARDS - UPDATE ON ISO 9241***Organizer: Tom Stewart*

Usability Standards - Update on ISO 9241 Tom Stewart, Floris van Nes, Ahmet Cakir, Tomas Berns, Susan Harker, and Thomas Geis	392
--	-----

**❁ VIRTUAL REALITY****VIRTUAL REALITY I**

Comparing Designers' Point of Views in Virtual Reality and Training Simulation : A Cognitive Discursive Analysis Approach Jean-Marie Burkhardt and Marion Wolff	395
Investigating the Possibility of Design Simulation Based on Mixed Reality Woohun Lee and Tek-Jin Nam	399
Study of Feedback Issues in Virtual Sculpting Wei Zhang, Heng Lin, and Xiaofang Wang	403
VR Experience Design in Tangible Space: Heritage Alive! Hyun-Jhin Lee, Jinwook Kim, Heekap Ahn, Sang Chul Ahn, Ik Jae Kim, Hyoung-Gon Kim, and Heedong Ko	407

The Benefits of Spatial Proximity for an Inspection Task Kyung H. Chung	411
<b>VIRTUAL REALITY II</b>	
Telepresence, Performance and Workload in an Immersive Virtual Environment and Sporting Task Ruiqi Ma and David B. Kaber	415
A Study on Application of a Monocular See-Through Head-Mounted Display for Visual Tracking Miwa Nakanishi and Yusaku Okada	419
Effects of Monocular Head Mounted Display on Visual System Hidenori Togami, Hiroyuki Izumi, Noriaki Satoh, and Masaharu Kumashiro	423
Human Factors Issues in Multimodal (Speech/Gesture) Interface Chang Joo Lim, Sanshzar Kettebekov, and Rajeev Sharma	428
Speech Related Navigation - a Challenge for Human-Computer Interaction? Mikko Laakso, Lauri Repokari, and Lauri Savioja	432
Application of an Illusion for Tactile Interface Hiroyuki Morikawa, Takashi Kawai, Hiroshi Kubota, and Hidefumi Nagashima	436
<b>HUMAN FACTORS IN VIRTUAL ENVIRONMENT SYSTEM</b>	
<i>Organizer: Jae Hee Park</i>	
Human Factors in Virtual Environments?: The VIEW of the Future Project John R. Wilson	440
Development of VR and Internet Based Kansei Engineering System Yukihiko Matsubara, John Wilson, and Mitsuo Nagamachi	444
Usability Evaluation of Virtually Prototyped Refrigerator Grips Using a Haptic Device Jae Hee Park, Inseok Lee, Heedong Ko, and Jinwook Kim	448
The Application of Feedback in Reducing Cybersickness in a Virtual Reality Young Youn Kim, Eun Nam Kim, Jae Hee Park, Heedong Ko, and Hyun Taek Kim	451
Virtual Evaluation of Automobile Interior Design Using Impression-Based Customer Preference Analysis Chulwoo Kim, Myung Hwan Yun, and Heedong Ko	455
<b>🌐 HCI &lt;POSTER&gt;</b>	
<b>HCI I</b>	
Development of Technical Information Processing with System Ergonomics Analysis/Assessment Tool (SEA-Tool) Heiner Bubb and Iwona Jastrzebska-Fraczek	459
Adaptive Face Model Compression Using Surface Properties Taehwa Han, Kyong Pil Min, and Jun Chul Chun	463
Tutor Activity in Open Learning Systems: Using Local Practice to Help Develop Support Technologies David Ireland, Rod Graves, and Paul Hare	467
Choosing the Best Pointing Devices Suitable for a Notebook Computers Mizutani Masashi	471

Cognitive Characteristics and Control Strategy for Positioning Tasks in Various Positions and Directions Based on the Human Body 474  
Akira Okada, Miki Fuchigami, and Kuniko Yamashita

Mental Representation about the Attendance of The Computer Science' Professional 478  
Andrea Silva and Luiz Bueno da Silva

Evaluation of Virtual Conferencing for Ergonomics 482  
Andrew Thatcher and Jonathan P. James

## HCI II

Evaluating Web Usability on the Basis of Visitor's Eye Movements 486  
Noriyuki Aoyama, Masaki Matsumoto, Shouhei Nomura, Chiho Unezaki, and Tadahiko Fukuda

A Study on the Web Interface Design by Using Integrated Logging-Tool 488  
Tsutomu Konosu, Hironori Kobayashi, and Hiroyasu Toriyabe

Design of University Web Sites 492  
Ameersing Luximon, Marina Sahakyan, and Sona Aghayan

Assessing Web Use Ability in Terms of Eye-Hand Coordination Theory 496  
Shohei Nomura and Tadahiko Fukuda

A Cross-Cultural Survey of User Perception on Web Icon Design for E-Library 500  
Sui-Rhane Chung and Jin-Ho Lee

Usability Evaluation Using Protocol Analysis and the Check Sheet Together for an Application Form 504  
Tabata Yukitoki, Atsushi Muramatsu, Hidetoshi Yoshioka, Takuo Matsunobe, and Toshiki Yamaoka

The Usability of Web Pages: The Role of the Relationship of Color Contrast and Amount of Information 508  
Chiho Unezaki, Noriyuki Aoyama, Shohei Nomura, and Tadahiko Fukuda

## ● HCI APPLICATION

### HCI APPLICATIONS

*Organizer: Sheue-Ling Hwang*

An Investigation on the Positioning Trajectory for Mouse and Gesture Input 510  
Kuo-Hao Tang

A Design Framework for Managing User Perception of Speech Recognition Errors 515  
Lifen Yeh, S. L. Hwang and M. Y. Wang

A Study on E-shop Consumer Decision Factors on Internet 519  
Eric Min-yang Wang and Jones Chang-Ru Wu

Towards a Cross-Cultural Human-Computer Interaction 523  
Sheau-Farn Max Liang and Thomas Plocher

A User-Centred Approach to Digital Camera Design: Maximising Usability and Facilitating Acceptance of Technology Using Psychological and Ergonomic Principles 527  
Chandra M.Harrison

PC Based VR(Virtual Reality) Interface System 531  
Min Chul Park, Sang Ju Park, and Deok Ha Woo

## ● COMPLEX SYSTEM

### COMPLEX SYSTEM I

- An Information Theoretic Approach to Quantifying the Information Flow of Diagnosis Tasks in Nuclear Power Plants 534  
Jong Hyun Kim, Seung Jun Lee, and Poong Hyun Seong
- Ergonomics and Reliability of High Risk Organizations: the Nuclear Power Plant Operation Under the Complexity Theory Paradigm 538  
Paulo V. R. Carvalho and Mario Cesar Rodriguez Vidal
- Ergonomics in Licensing and Evaluation of Nuclear Power Plant Control Rooms 542  
Isaac Jose Antonio Luquetti dos Santos, Mario Cesar Rodriguez Vidal, and Paulo Victor Rodrigues de Carvalho
- Tracing Interface Design Solutions for an Electricity Distribution Network Control System using the Abstraction Hierarchy 548  
Sotiria S. Drivalou and Nicolas Marmaras
- Development of a Method for Human Factor Review and Analysis of Human Errors in Nuclear Power Plants 552  
Yeonsub Jung, Moon Goo Chi, and Ju Taek Kim
- A Development of an Analysis Technique for Human Errors in Nuclear Power Plants 556  
Tong Il-Jang, Yong H. Lee, and Hyeon K. Lim

### COMPLEX SYSTEM II

- A Contribution of Ergonomics in Driving Assistance System Design and Assessment 560  
Claude Lemarchand and Nassim Boudaoud
- Adaptive Cruise Control and Driver Workload 565  
Heather A. Parker, Alice R. Malisia, and Christina M. Rudin-Brown
- Driver Behaviour during Left Turn and Driver - Type - a Field and a Simulator Experiment 568  
Oliver Meyer, Muriel Didier, and Kurt Landau
- Visual Modeling of a Passenger Vehicle Driver Space Based on the Forward Kinematics Model 572  
Sung-Jae Chung and Min-Yong Park
- Preliminary Study on Effective Display Method of Luminous Lane Markers of the Advanced Cruise-Assist Highway Systems at An Intersection 576  
Tatsuru Daimon, Kotaro Matsumoto, and Hironao Kawashima

### HUMAN PERFORMANCE IN COMPLEX SYSTEMS I

*Organizer: Anand K. Gramopadhye*

- Human Performance in Technologically Complex Systems 580  
Anand K. Gramopadhye and David Kaber
- Human Factors and Inspection: Best Practices 584  
Colin G. Drury
- Supervisory Control of Multiple Simulated Robots through Human in the Loop Simulation 588  
Rakesh Dave and S. Narayanan
- An Easy-To-Use Participative Video-Computer Method for Ergonomic Evaluation of Complex Work 592  
Mikael Forsman, A. Poussette, O. Persson, A. Kjellberg, L. O. Grundell, J. Soprani, B. Bogardh, M. Christmansson, and R. Kadefors

Evaluating The Role of Humans in Hybrid Inspection Systems Xiaochun Jiang, Anand K. Gramopadhye, and Mohammad T. Khasawneh	596
<b>HUMAN PERFORMANCE IN COMPLEX SYSTEMS II</b>	
<i>Organizer: Anand K. Gramopadhye</i>	
Beyond Compliance-Based Safety: A Discussion of Safety Attitudes and Behaviors among Flight Students Manoj S. Patankar and Gary J. Northam	600
Human Patient Simulators as a Human Factors Research Tool in Patient Safety Melanie C. Wright and Jeffrey M. Taekman	604
Human-Robot Interaction Research and an Approach to Mobile-Telerobot Interface Design David B. Kaber and Mo-yuen Chow	608
Human Performance in Complex Systems Dahai Liu and Ram R. Bishu	612
Supporting Assessments of Uncertainty in Complex Worlds Mica R. Endsley	616
<b>● AGRICULTURE &amp; ECOLOGY</b>	
<b>AGRICULTURE I</b>	
Transition of Agriculture - A Challenge for Work Science Peter S.R. Lundqvist	620
An Assessment of Occupational Health Hazards and Testing Efficacy of Developed Educational Package for Female Agricultural Workers Suman Singh, Rekha Vyas, and Neeta Lodha	624
Ergonomic Checklist for Improving Farm Work Yutaka Kikuchi and Fumitake Ishikawa	628
A Multi-Method Ergonomics Review Technique (MMERT) for Work Analysis and Design in Farming Pranab kumar Nag and Anjali Nag	632
Ergonomics Problems among Rice Farmers in Pathumthani, Thailand Surasak Buranatreveth and Peeungjun Sweatsriskul	636
Physical Workload on the Arms and Wrists during Machine Milking Stefan Pinzke, Marianne Stal, and Mikael Forsman	639
<b>AGRICULTURE II</b>	
Ergonomics of Harvesting Ground-Level Crops Gwanseob Shin, Yu Shu, Zheng Li, Zongliang Jiang, Theresa Costello, and Gary A. Mirka	643
Ergonomic Assessment of Rural Women in Weeding Sudesh Gandhi, Bimla, Mamta Dilbaghi, and Kusum Rana	647
3-D-Motion Analysis as a Tool for Objective Ergonomic Evaluation of Dynamic Horticultural Work Processes Martina C. Jakob, Martin Geyer, and Wolfgang Bokelmann	651
Ergonomic Evaluation of Pruning and Harvesting Tasks of Winegrape Trellis Systems Fadi A. Fathallah, John A. Miles, Julia Faucett, James M. Meyers, Ira Janowitz, Anrew E. Kato, Erica Garcia, David A. Reiter, Brandon J. Miller, and Diana G. Tejeda	655

Performance Evaluation of Sickles in Fodder Cutting 659  
Sudesh Gandhi, Mamta Dilbaghi, and Bimla

Technical Improvements of Equipment During Machine Milking in Loose-Housing Systems 663  
Marianne Stal and Stefan Pinzke

### **SYMPOSIUM ON AGRICULTURAL ERGONOMICS**

*Organizer: Tsuyoshi Kawakami*

Development of Agricultural Ergonomic Checkpoints 667  
Kazutaka Kogi

ILO's Efforts in Improving Safety and Health in Agriculture 671  
Tsuyoshi Kawakami

Development of Agricultural Ergonomic Checklist and Database of Improvement 673  
Yutaka Kikuchi, Fumitake Ishikawa, Makoto Nakano, and Mitsuo Suzuki

Experience of Wind Training Programmes in the Philippines 677  
Jose Maria S. Batino

### **● AGRICULTURE & ECOLOGY <POSTER>**

#### **AGRICULTURE & ECOLOGY**

Evaluation of Different Harvesting Aids for White Asparagus 681  
M.Geyer, S. Tischer, and M. Jakob

Life-Long Learning along the Food Chain 685  
Peter Lundqvist and Peter Friedrich

Towards Swedish Guidelines for Children's Agricultural Tasks 689  
Peter Lundqvist and Catharina Alwall

Comparison of Heart Rate Responses of Women Workers during Cutting of Fuelwood with Improved and Local Sickle 692  
Deepa Sharma, Poonam Tewari, Razia Begam, and Sunita Sharma

Environmental Impact Assessment in Sustainable Development Practice in Yugoslavia 695  
Nenad Zivkovic, Mirosljub Grozdanovic, and Dobrivoje Marjanovic
