There are many resources available to help employers, employees, healthcare professionals and others understand more about work-related diseases. Links to these resources can be found at: www.oem.msu.edu.

Background

This is the 22nd annual report on occupational diseases in Michigan, and is based upon the reports submitted to the Michigan Department of Licensing and Regulatory Affairs (LARA) in calendar year 2013. Since 1978, phy-

Acronyms

- BLS** Bureau of Labor Statistics
- LARA** MI Department of Licensing and Regulatory Affairs
- MDCH** Michigan Department of Community Health
- MIOSHA** Michigan Occupational Safety and Health Administration
- MSU OEM** Michigan State University Occupational and Environmental Medicine
- NAICS** North American Industrial Classification System

sicians, hospitals, clinics, other health professionals and employers have been required by the Michigan Public Health Code (Article 368, Part 56, P.A. 1978, as amended) to report known or suspected cases of occupational diseases. LARA designates Michigan State University's College of Human Medicine, Occupational and Environmental Medicine Division (MSU OEM) as its bona fide

Part 56 of the Michigan Public Health Code requires reporting of all known or suspected occupational illnesses or work-aggravated health conditions to the Michigan Department of Licensing and Regulatory Affairs within 10 days of discovery.

In 2013, 913 (1.4%) of the 65,846 human exposure-related calls to the Michigan Poison Control Center in Detroit were related to occupational exposures.

Background continued...

agent to compile and analyze the occupational disease reports.

A standard form is used to report individuals with a known or suspected work-related condition. It requests medical and demographic information on the affected employee as well as information about the facility at which the employee became ill. Figure 1 is a copy of the

Known or Suspected Occupational Disease reporting form.

Reports received are reviewed by MSU OEM staff and computerized.

In some cases, additional follow up is conducted. The reported patient may be contacted and interviewed by staff at MSU OEM to obtain more information about their illness. A Michigan Occupational Safety and

Health Administration (MIOSHA) enforcement inspection may be initiated at the patient's workplace to assess current working conditions and determine if other employees are experiencing similar health issues.

Reports are analyzed on a yearly basis and the results are shared with health professionals and other stakeholders.

METHODS

An occupational disease (OD) report is initiated when a clinician knows or suspects that a patient's illness is work-related. Reports are submitted by or requested from a variety of sources, listed below. Additional reports are generated through annual review of the Michigan Health and Hospital Association inpatient database.

SOURCES TO IDENTIFY PATIENTS

- ◆ **Health Care Providers** Private practice, working for industry, NIOSH-certified "B" readers, audiologists, clinics
- ◆ **Employers**
- ◆ **Hospitals** for International Classification of Diseases—9th Revision (ICD-9)¹ 502, 501, 495, 496, 491, 492, and other select work-related conditions
- ◆ **Workers' Compensation Agency**
- ◆ **Poison Control Center** data for work-related poisonings
- ◆ **Reports from Co-Workers or MIOSHA Field Staff** confirmed by a health care provider
- ◆ **Death Certificates** for ICD-10 Cause of Death (COD) or contributing COD J61, J62.8, J63, J64, J65, J67; if Underlying COD J45, J68
- ◆ **3rd Judicial Circuit State Court of Michigan** for asbestos-related disease
- ◆ **Mine Safety and Health Administration**
- ◆ **Michigan Cancer Registry** for mesothelioma
- ◆ **Clinical Laboratories** for blood lead analyses, and specific IgE allergy testing

OD reports are used to direct surveillance, intervention and prevention activities. The computerized OD report information includes: 1) employee name, age, sex, race, zip code and optional partial social security number; 2) employer name, worksite address, city, zip code, number of persons employed at the facility and an assigned North American Industry Classification System (NAICS) code; 3) details of the illness, diagnosis date, suspected causative agent(s), vital status, and an assigned ICD-9 code; and 4) information about the individual who submitted the report, including whether the reporter is employed by the company, an outside medical department contracted by the company, or a private practice health professional.

More than one report on a given individual with different work-related diseases may be submitted to LARA within a given year and across multiple years. If several reports are submitted for acute illnesses for a single individual, all of the reports are included in our statistics. In contrast, if more than one report is submitted in a given year for a chronic disease in a single individual, only one of the submissions is included in our statistics. If multiple reports are submitted over several years on that individual's chronic disease, only the earliest report is included in our statistics (see list below for chronic diseases).

CHRONIC OCCUPATIONAL DISEASES COUNTED ONLY ONCE

ICD-9	DESCRIPTION
011	Pulmonary TB
015	TB of Bones & Joints
135	Sarcoidosis
137	TB, Late Effects of
140-239	Cancer
250-259	Diseases of Other Endocrine Glands
260-269	Nutritional Deficiencies
270-279	Metabolic & Immunity Disorders except 276, Dehydration
280-289	Diseases of the Blood & Blood Forming Agents
290-319	Mental Disorders except 308 (Acute Reaction to Stress) & 309 (Adjustment Reaction)
320-340	Select Diseases of the Nervous System & Sense Organs
388-389	Noise-Induced Hearing Loss, Tinnitus
390-409	Select Diseases of the Circulatory System
491-505	Select Diseases of the Respiratory System
509	Pleural Plaques w/no Parenchymal Abnormality on ILO form
515	Interstitial Lung Disease, Pulmonary Fibrosis
517	Connective Tissue Lung Disease
520-579	Diseases of the Digestive System
580-629	Diseases of the Genitourinary System

The 2012 Annual Report on Silicosis & Other Work-Related Lung Disease contains information on Asbestos-related lung disease that was formerly in the OD Annual Reports. The report can be found at: www.oem.msu.edu

RESULTS

A total of 9,623 occupational disease reports were submitted to LARA in calendar year 2013. Figure 2 shows the number of reports received each year since 1985.

Reporting Source

Company or contract medical departments submitted 61% of the reports (5,885 cases); non-company associated health care practitioners submitted 39% of the reports (3,738 cases). Figure 3 shows the trends by reporting source (company or non-company associated) since 1991.

Company Size

Half of the reports were submitted on individuals who worked in large companies (Table 1) with 51% of the 6,654 reports that listed company size coming from businesses with > 500 employees.

A greater proportion of reports for companies with 500 or fewer employees come from non-company health practitioners. About 83% of the 1,055 reports with known company size that were submitted by non-company practitioners involved companies with < 500 employees, while about 43% of the 5,599 reports with known company size submitted by company practitioners involved facilities with < 500 employees.

Non-Company Clinicians

One hundred seventy-four non-company-associated clinicians reported 340 incidents of occupational disease. Thirty labs were

Figure 2
OD Reports to LARA by Year Reported: 1985-2013

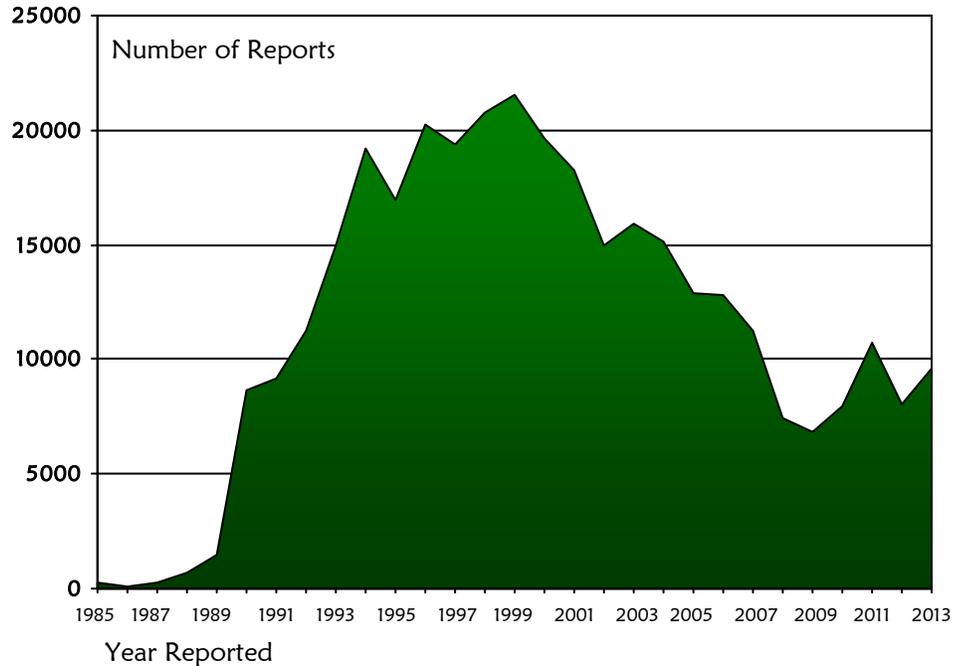

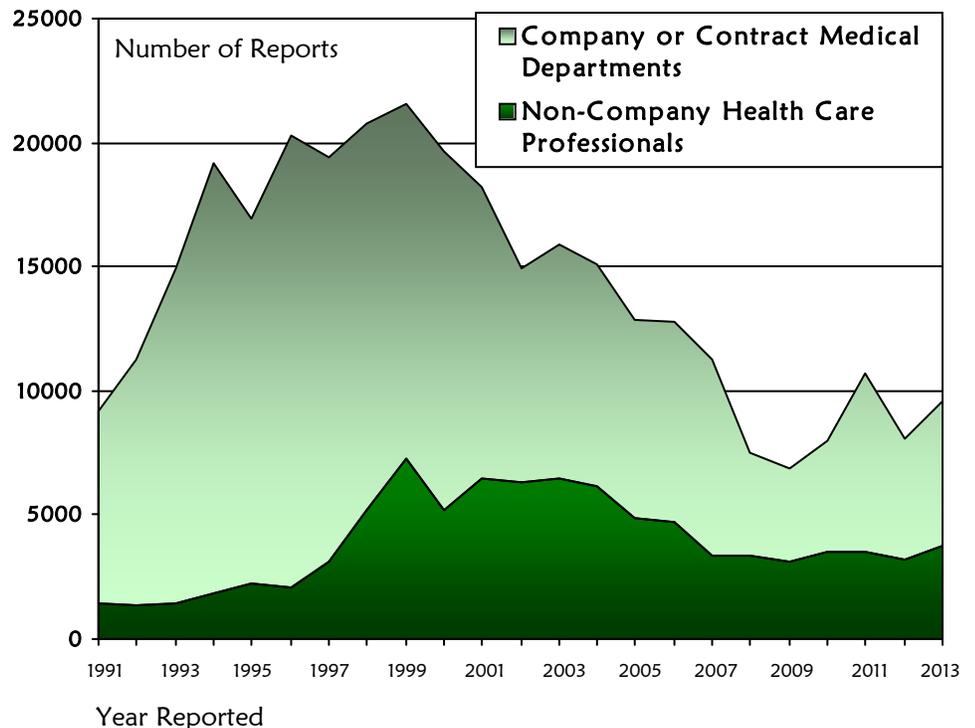

Figure 3
OD Reports by Year and Reporting Source: 1991-2013

RESULTS, continued...

responsible for identifying 1,978 reports of lead poisoning. In addition, the Michigan Poison Control Center reported 825 incidents of work-related poisonings, the 3rd Circuit Court of Michigan reported 306 asbestos-related claims, and hospitals reported 289 patients with work-related conditions. One hundred fifty-eight (91%) of the clinicians reported only one patient each in calendar year 2013 (Table 2); one clinician reported 106 patients; this clinician is certified to interpret chest x-rays for dust-related lung disease (“B” readers). A “B” reader is a licensed physician who has passed a test on interpreting chest x-rays for pneumoconiosis and maintains certification by passing an additional test every four years. In 2013, there were six Michigan physicians who were listed as “B” readers on the NIOSH “B” reader website.

Occupational Health Clinics

There are approximately 187 occupational health clinics in Michigan. From June 2005 to 2009, the number of such clinics reporting occupational disease cases to the State increased from 21 to 56. In 2010, the number of reporting clinics dropped to 44, in 2011 increased to 64, in 2012 decreased to 61 and in 2013 increased to 66. Biennial audits of a sample of non-reporting clinics began in 2009.

Demographics

Table 3 shows the age, gender and race distribution of the workers with occupational diseases reported in the year 2013. The mean age of reported patients was 45 ± 14 years (range, 15 to 101 years) with ap-

proximately two-thirds of the patients (67%) between the ages of 25 and 54 years. One hundred eleven reports were submitted for patients age 19 or younger, and 113 reports were submitted for patients age 80 and older.

Sixty-six percent of all reports submitted were for male workers. Ninety

-four percent of the submitted reports (9,013 cases) did not indicate the worker’s race. Of the 610 reports that did indicate race, 80% were Caucasian, 13% were African American and 7% were Hispanic.

Hispanic	43	7.0
Total ^c	610	100.0
^a Age was unknown for 2,561 reports. Mean age 45 ±14 yrs. ^b Gender was unknown for 341 reports. ^c Race was unknown for 9,013 reports.		

Younger Workers

Of the 63 workers *age 18 and younger*, four were 15 years old, eight were 16 years old, 15 were 17 years of age, and 36 were 18 years old. Twenty-four (38%) of the reported patients age 18 and younger were female and 39 (62%) were male. Place of employment was unknown for 56 of the 63 younger workers. Of the seven with known employment type, three worked in manufacturing, two worked in the trades industry, and one each worked in waste management services and health care services.

Five of the younger workers were reported by a company-affiliated clinician or clinic. Thirty-four were reported by the Poison Control Center, 17 were for respiratory symptoms, five were for an elevated blood lead level (serum lead levels were between five and six micrograms per deciliter), three were for general symptoms, two for skin diseases, and one each was for tenosynovitis and conjunctivitis. No work-related fatalities for workers age 18 or younger were identified in 2013.

Older Workers

Of the 113 workers age eighty and older, 107 (95%) were between the ages of 80 and 89, and six (5%) were between 90 and 101 years of age. Thirty-nine were men and 27 were women. Gender was unknown for 47 of the older workers. Twenty-two of the older patients worked in or were retired from manufacturing, five worked in construction, and two worked in utilities. Industry or former industry was not indicated in 84 reports.

Private practice clinicians not associated with any company reported 112 of the 113 patients. Fifty-eight of the older workers were reported for dust-related lung disease (including 24 with lung cancer, 22 with asbestosis, 11 with silicosis and one with pleural thickening), 52 for elevated blood lead levels (serum lead levels were between 5 and 24 micrograms per deciliter), and one each for respiratory symptoms, digestive symptoms and a wrist sprain.

Illness Information

Table 4 shows the distribution of diagnoses or clinical impressions by reporting source. Diagnoses were grouped by major International Classification of Diseases categories (ICD-9th Revision). Overall, repetitive trauma conditions (sprains and strains) were the most frequently reported conditions, with 3,418 cases representing 36% of all OD reports submitted.

Toxic effects of substances (poisoning) were the second most frequently reported, with 2,483 (26%) cases. Diseases of the nervous system and sense organs were the third most frequently reported conditions, with 878 (9%), followed by symptoms, signs and ill-defined conditions which were the fourth most frequently reported condition, representing 865 (9%) of the cases. Respiratory diseases were reported for 713 cases representing 7% of all reports submitted. There were 637 (7%) musculoskeletal disease reports, 347 (4%) reports of skin

^aPercent does not add to 100 due to rounding.

diseases, 111 (1%) reports of cancers, and 92 (1%) reports of mental disorders (stress-related illnesses). Less frequently reported conditions included diseases of the digestive system, infectious and parasitic diseases, and diseases of the circulatory system.

Reporting Source Differences

Company and non-company-affiliated providers differed markedly in the types of occupational diseases reported (Table 4). Fifty-seven percent of reports from company health care providers were of repetitive trauma illnesses, while one percent of reports by non-company providers represented these diagnoses. Conversely, 57% of non-company reports were of toxic effects of substances (poisonings), compared to 6% of company submissions. The second, third and fourth most frequently reported diagnoses for company providers were diseases of the nervous system and sense organs (12%), musculoskeletal; diseases (11%) and skin disorders (6%). Respiratory diseases were the second most frequently reported diagnoses by non-company providers (17%). The third and fourth most frequently reported diagnoses for non-company providers were symptoms, signs and ill-defined conditions (15%) and diseases of the nervous system and sense organs (5%).

Company and non-company practitioners differed by industries represented in their reports (Table 5). Company-affiliated healthcare providers and non-company-affiliated physicians reported high percentages of patients employed in manufacturing (60% and 36%, respectively), primarily automobile production. The second and third most frequently reported industries by company providers were healthcare and social assistance (8%) and retail trade (6%). The second and third industry types most frequently reported by non-company providers were construction (32%), and utilities (8%). Industry type was missing on 2,386 non-company and 34 company reports.

Gender Differences

Repetitive trauma was the most frequently reported diagnosis for women and men, with 49% and 35% of submissions, respectively (Table 6). The second, third and fourth most frequent diagnoses for men were poisonings (30%), diseases of the nervous system and sense organs (10%), and symptoms, signs and ill-defined conditions (8%). For women, the second, third and fourth most frequently submitted diagnoses were ill-defined symptoms (12%), poisonings (11%) and musculoskeletal diseases (9%). Three hundred forty-one reports did not indicate gender.

Fatalities

Fatalities related to occupational illnesses were reported for 110 workers (Table 7). None of the illness-related fatalities reported were from acute incidents. Non-company clinicians reported all 110 of the fatalities. The workers who died ranged in age from 49 to 92 years. Eighty died from asbestos-related cancer, 27 from asbestosis, two from other lung disease and one from silicosis. Twenty-five of the deceased workers had been employed in manufacturing, eight in utilities, and four in construction. Former occupation was not specified for 73 workers.

Michigan has a separate program to track acute traumatic fatalities, called MIFACE (Michigan Fatality Assessment and Control Evaluation). The MIFACE program identified an additional 135 traumatic work-related fatalities from injuries in 2013 that occurred in Michigan (provisional data). A separate report for the most recent work-related fatalities (2012 calendar year) can be found at: www.oem.msu.edu. There were two deaths among two 19 year-old youths identified in the MIFACE Program in 2013.

RESULTS, continued...

Comparison with Other Data Systems

No one reporting system captures the true burden of occupational disease. The following section looks at other reporting systems and the contribution each makes to the overall characterization of work-related illness in our state.

Table 7

Demographic Characteristics of Reported Occupational Disease Fatalities in 2013

Published Aggregate Data in MI

Table 8 compares data from the OD reporting system with Workers' Compensation Agency claims and the BLS Annual Survey. These data illustrate the variation of reported disease categories by reporting source and suggest that the magnitude of occupational diseases among Michigan workers is greater than what currently gets reported.

The most quoted data source on occupational injuries and illnesses available in Michigan comes from the BLS Annual Survey of company injury and illness logs. In 2013, there were a total of 117,400 injuries and illnesses of which 56,700 were severe enough to cause loss of work days, job transfer or restriction. Of the 117,400 total, 8,200 were occupational illnesses and 109,200 were occupational injuries.

Data from Michigan's Workers' Compensation Agency (WCA) for 2013 showed 21,935 claims for occupational injuries and illnesses with seven or more consecutive days away from work. Overall in 2013, about \$518 million in compensation was paid by insurance companies and self-insured employers on 210,698 claims for both lost work time and medical-only costs. These claims include new claims filed in 2013, as well as previous claims for workers who continue to lose work time or incur medical costs due to their injury or illness. Sixty-seven percent of the total paid claims in 2013 were for medical procedures or care only and 33% for wage loss (http://www.michigan.gov/documents/wca/2013_Annual_Report_452255_7.pdf).

Other Sources-Hospital Discharge Data

The hospital discharge data described in this next section is not part of the 9,623 occupational disease reports described in the 2013 Annual Report. Hospital discharge data does not include identifiers; presumably some of the patients overlap with those in the 9,623 OD reports. However, especially for long latency, chronic diseases like asbestosis, it would be difficult to identify newly diagnosed patients. Therefore, the hospitalization data in this section should be considered as supplemental to the 9,623 OD reports submitted to the state in 2013. The most recent data available from the MHA is for calendar year 2013. The following section looks at hospital data where Workers' Compensation is the expected payer.

ND = There was no data for this disease category.

If the source of payment changed after the patient was treated and discharged from the hospital, such as might occur in a disputed workers' compensation case, it is likely that this change would not be captured in the MHA data reported in this section. Figure 4 shows the number of patients, as well as hospitalizations, with Workers' Compensation (WC) insurance designated as the primary payment source at discharge for the years 1992 through 2013; the numbers of hospitalizations from 1995-2013 decreased compared to the years 1992-1994. In addition, the percentage of hospitalizations with WC insurance designated as the primary payment source at discharge decreased beginning in 1993 (Figure 5). For both these parameters, there was a plateau in the decrease from 2004 to 2008. However, there was also a decrease in 2009-2013 in both these parameters. In 2009, 0.30% of the 1,305,935 Michigan hospitalizations designated WC insurance as the primary payment source at discharge; in 2013 0.25% of the 1,229,393 Michigan hospitalizations designated WC insurance as the primary payment source at discharge.

Table 9 shows the primary discharge diagnosis for hospitalizations from 2002 to 2013 where WC insur-

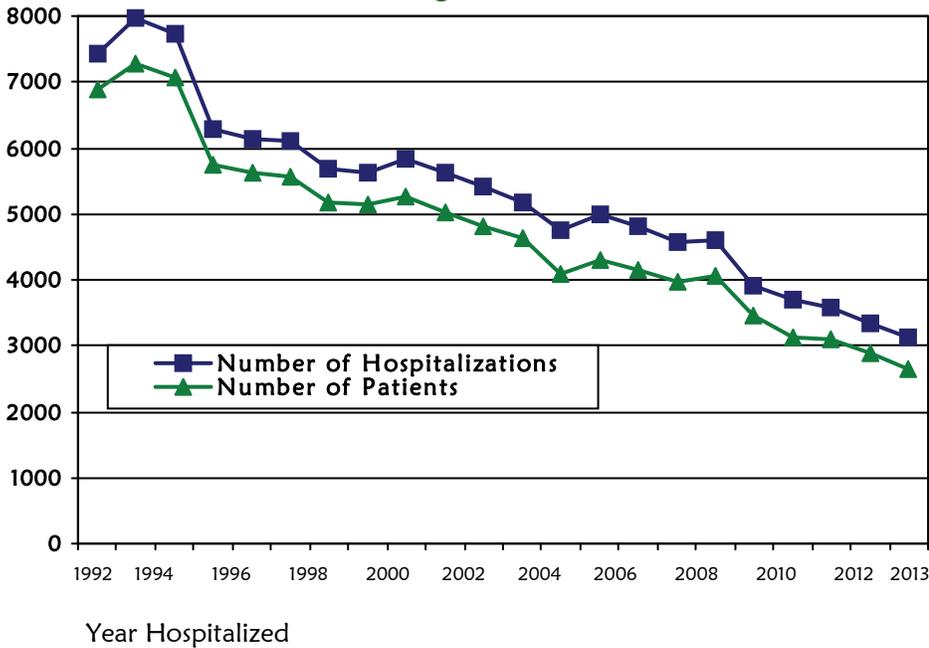

ance was designated as the primary payment source at discharge. WC insurance covers a broad range of conditions, including mental illness, infections, heart disease and cancer. The most common two hospitalized conditions covered by WC insurance were injuries and poisoning accounting for 49%, and musculoskeletal diseases, accounting for 25% of all WC-related patient hospitalizations.

Table 10 lists the demographics of patients with WC insurance as the primary payment source at discharge. From 70-76% of the hospitalizations were for men, across all years from 2002 to 2013. Among hospitalizations for which race was known, approximately 85-90% were white, 7-11% were African American, <1% were Asian, and 2-5% were listed as "other."

Most hospitalizations involved workers between the ages of 40 and 59 years. Less than 1% involved workers under the age of 15. The percentage of workers 80 years or older has ranged over time from <1-4%. The percentage of hospitalizations of workers under the age of 20 has decreased slightly over time, from 3% in 1992 to less than 1% in 2013 (1992 data not shown).

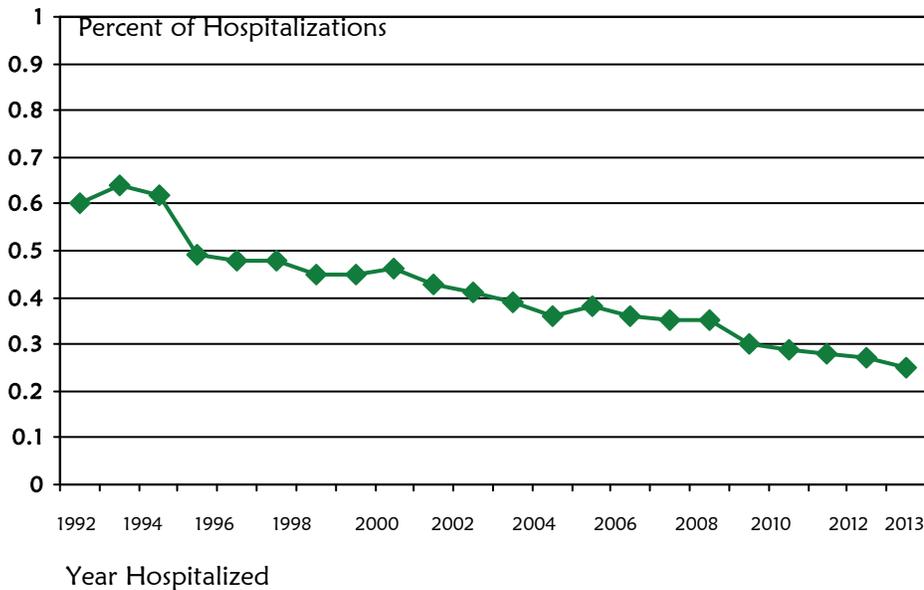

RESULTS, continued...

Figure 4
Hospitalizations and Patients with Workers' Compensation Designated as the Primary Payment Source at Discharge in Michigan: 1992-2013

The number of hospitalizations and patients with Workers' Compensation as the primary source of payment in Michigan has steadily declined over time.

Figure 5
Percent of Total Michigan Hospitalizations with Workers' Compensation Designated as the Primary Payment Source at Discharge in Michigan: 1992-2013

In Calendar year 2013, there were 1,229,393 hospitalizations in Michigan. Of those, only 0.25% were paid for by Workers' Compensation. The percent of hospitalizations paid for by Workers' Compensation in Michigan has steadily declined over time.

Poison Control Center Data

In 2013, 825 calls to the Michigan Poison Control Center (PCC) were identified for individuals with work-related symptoms. Table 11 describes available demographic characteristics and disease categories of the individuals reported. There were more reports for males (62%). The individuals ranged in age from 15 to 82 years. Eighty-three percent of these individuals were less than age 50. Of the 825 calls to the PCC in 2013, the top calls included: 211 (26%) for nervous system symptoms, 180 (22%) for allergic reactions, 147 (18%) for skin-related symptoms, and 118 (14%) for nausea and vomiting.

Adult Blood Lead Epidemiology and Surveillance (ABLES)

In 2013, there were 12,718 adult Michigan residents reported by labs as having their blood tested for lead. Table 12 describes the demographic characteristics of the 1,960 individuals reported with a blood lead level of 5 ug/dL and above. Most individuals were males between the ages of 30 and 59. Construction and manufacturing were the most frequently reported industries of lead exposure. A comprehensive report on all blood lead levels in Michigan can be found at: www.oem.msu.edu, the 2011 Annual Report on Blood Lead Levels on Adults in Michigan.

DISCUSSION

There were 9,623 Occupational Disease Reports sent to LARA in calendar year 2013. This report does not include occupational injuries. The most frequent types of occupational diseases reported to LARA were repetitive trauma illnesses (36%), toxic effects of substances (26%), diseases of the nervous system and sense organs (9%), symptoms, signs and ill-defined conditions (9%) and respiratory diseases (7%). From 1988 through 1999, the number of reports sent to the State increased substantially. Figure 2 shows the number of occupational disease reports received each year since 1985. Since 1999, the number of reports had been decreasing, except for the increase in 2003, 2010, 2011 and 2013. There was a large decrease in the number of reports received in 2005, with over 2,200 fewer reports received than in 2004; in 2009 the total number of reports decreased by over 640 from 2008. In 2010, the number of reports increased to 7,952, an increase of over 1,000 reports since 2009, and in 2011 to 10,701, an increase of almost 4,000 reports, a decrease of 2,548 reports in 2012, and an increase of 1,554 reports in 2013.

The initial overall decline in the number of reports reflected fewer reports from company medical departments. The number of reports from non-company-affiliated practitioners remained relatively unchanged through 2004; however, from 2004 to 2009, there was a large decline of approximately 3,000 reports in the number of non-company-affiliated practitioner reports as compared to 2004 (Figure 3). The number of company-affiliated physicians or medical departments reporting increased in 2013 to 210, compared to 179 in 2012, 188 in 2011, 185 in 2010, 194 in 2009, 449 in 2008, 426 in 2007, 396 in 2006, 374 in 2005, 373 in 2004 and 305 in 2003.

ICD-9 codes were used to classify the diagnosis or clinical impression recorded on the occupational disease reports submitted to LARA. Sprains and strains, except those involving the back, are considered by the federal and Michigan OSHA programs as illnesses secondary to cumulative trauma, and are therefore required to be reported even though in the ICD-9 coding system, sprains and strains are classified as injuries.

Many employers, physicians and other healthcare providers do not report patients with occupational diseases

either because they are unaware of the reporting law or choose not to report for a different reason. Currently, reports are received from approximately 210 company-affiliated physicians reporting employees from 1,446 different companies; there were 174 non-company-affiliated physicians reporting patients to the state. There were 230,385 companies in the year 2013 and 29,881 licensed physicians in Michigan in the year 2013. Accordingly, reports are received from 0.6% of companies and 0.6% of physicians. Over the last several years, these percentages have remained largely unchanged. Efforts continue to remind employers of the requirement to report by routinely distributing reporting forms during MIOSHA inspections. In addition, all new physicians receive information on the requirement to report when they apply for medical licensure in Michigan.

The 9,623 occupational disease reports received this past year under-represent the actual incidence of occupational diseases in Michigan. Based on an MSU study matching multiple data bases in Michigan for the years 1999-2001, one could estimate that the BLS survey missed 50% of the total number of occupational illnesses in Michigan². For 2013, the most recent year available, the BLS annual survey reported 8,200 illnesses; by extension one would expect 19,000 illnesses in 2013 instead of the approximately 9,600 reported in that year. Even these types of estimates are an underestimate because it assumes that all physicians recognize work-related illness in their patients and that all employers are informed when work-related conditions are diagnosed. These assumptions often go unmet, given the limited training that healthcare providers receive in diagnosing work-related conditions, and that many individuals never inform their employer when they are diagnosed with a work-related condition.

The type of illness and industry where occupational diseases occur as reported by non-company-affiliated healthcare practitioners differs from company-based healthcare practitioners (Tables 1, 4 and 5). The differences vary depending on the specialties of the non-company-affiliated physicians who submit reports. For example, in 2013 the non-company-affiliated health care practitioners were more likely to report patients with respiratory disease who work in small, non-manufacturing companies. A large percentage of the

DISCUSSION

year 2013 reports from non-company-affiliated health care practitioners were from physicians who are specialists in the radiographic interpretation of mineral and dust-related lung disease. However, regardless of the mix of non-company-affiliated specialists reporting, the data illustrates that relying on company-affiliated reports alone would cause occupational illness statistics to markedly undercount certain work-related conditions. Similarly, one cannot rely on Workers' Compensation data for a reliable count of work-related conditions. In a study covering the years 1992-1994, only 9.6% of the workers for whom an Occupational Disease Report was submitted had definitely filed a WC claim, although an additional 36% may have filed a claim for a total of 45.6%³. In that study, limits of the data did not allow for a more precise estimate of the claims filed, but the range underscores the point that a large number of workers do not file WC claims even though they are seen by a physician for their illness. This is an ongoing issue, as review of hospital discharge data for individuals with pneumoconioses shows only <1% - 8% paid by WC (2012 Annual

Report: Tracking Silicosis and Other Work-Related Lung Diseases in Michigan, available at: www.oem.msu.edu).

Review of Table 8 shows a large difference in the distribution of occupational illnesses identified through the state's OD reporting system, compared to both the BLS Annual Survey of Employers and the state's WCA claims system. For example, poisoning represents approximately 26% (2,192) of the OD reports, while that category of diseases only accounts for approximately 2% (200 cases) of the BLS survey and <1% (4 cases) of WCA claims. Non-employer sources such as from the Poison Control Center, "B" Readers and laboratories provide additional occupational diseases not being reported by employers or practitioners.

In addition to tracking the overall incidence of occupational disease, a more comprehensive system allows us to identify areas of concern in our state, monitor trends, develop interventions designed to prevent additional occupational disease, and subsequently evaluate the effectiveness of these efforts.
