FOREWORD

This is the ninth edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS). The annual publication of a list of known toxic substances is a NIOSH mandate under the Occupational Safety and Health Act of 1970. It is intended to provide basic information on the known toxic and biological effects of chemical substances for the use of employers, employees, physicians, industrial hygienists, toxicologists, researchers, and, in general, anyone concerned with the proper and safe handling of chemicals. In turn, this information may contribute to a better understanding of potential occupational hazards by everyone involved and ultimately may help to bring about a more healthful workplace environment.

Occupational Safety and Health

PREFACE

This 1979 edition of the NIOSH Registry of Toxic Effects of Chemical Substances (RTECS) has been published in two volumes because of the increased number of substance entries in the RTECS file. However, we have retained the same format that was used for the 1978 edition: all substance prime names and synonyms are listed in alphabetical order, and each synonym is cross-referenced to its appropriate prime name accession number. Volume One contains prime names and synonyms beginning with A through I; Volume Two contains those beginning with J through Z. The accession numbers in Volume One are AA4290000 through NY5645000; those in Volume Two are NY5775000 through ZI2975000. Also included in Volume Two are the Bibliographic References and Appendixes.

All readers are strongly encouraged to review the Introduction and Detailed File Description in this volume before using the Registry. This material contains a complete description of the types of data contained in the RTECS file, including an explanation of the applicability and limitations of the data.

This 1979 Registry contains approximately 5,300 new substances and 8,700 new toxicity data lines. In addition, the following changes have been made:

1. A new toxicity data field, entitled Mutation Data, has been added. This field includes insect, bacterial, and mammalian cell mutation data, as well as the whole animal (in vivo) mutation data cited in previous editions of the Registry with the code "TFX:MUT" in the toxic dose lines. A complete description of the mutation data line is provided in paragraph 7 of the Detailed File Description. As usual, only positive mutation data are cited in the Registry.

The mutation data line was developed in response to the recent rapid development of in vitro mutagenicity tests and their use in evaluating chemical toxicity. Perhaps the most well-known of these is the Ames test, developed by Dr. Bruce N. Ames and his coworkers at the University of California. In vitro tests utilize primarily bacterial species and mammalian cell lines. They are comparatively simple and less expensive to perform than the multigenerational mammalian and insect (primarily drosophila) studies previously used in mutation research. However, in vitro studies still provide a method for measuring the effect of a substance on the genetic material of the tested species. According to the National Toxicology Program (NTP) Fiscal Year 1980 Annual Report (page 23), "Mutagenicity assays identify structural or functional DNA perturbations in germinal or somatic cells. Effects in germ cells are important for predicting potential undesirable effects on fertility, the developing conceptus, or in generations subsequent to that which received chemical exposure. Somatic mutation may be predictive for physiologic alterations in the exposed person and for the potential induction of cancer."

The relative ease with which in vitro mutagenicity tests can be conducted is contributing to their use as screening tests for large numbers of substances. Those compounds with positive results may then become candidates for more thorough acute and chronic in vivo testing. Furthermore, as indicated in the above NTP statement, it is argued that somatic cell mutation may be indicative of potential carcinogenesis. Although there is a positive correlation between substances that yield positive in vitro mutagenesis results and those that are carcinogenic in whole animals and man, there still remains some disagreement as to the significance of in vitro data. Despite this disagreement, the literature contains a significant amount of in vitro data, and more continues to be published. Therefore, in an attempt to serve as a single reference source for various types of toxicity data, the Registry now includes insect, bacterial, and mammalian cell mutagenesis data, as well as in vivo data. However, the Registry makes no attempt to evaluate the significance of these data as a predictor of either mutagenic or carcinogenic risk to humans. For additional information, the reader may wish to consult the NTP annual reports and technical bulletins. These are available from NTP, P.O. Box 12233, Research Triangle Park, North Carolina 27709.

2. An "Update" field has been added to each substance's data record. This field indicates when the record was last updated and can be used to monitor the changes for a given substance(s). See paragraph 2 of the Detailed File Description for a complete explanation.

3. The RTECS file has been matched against the July 1979 EPA Toxic Substances Control Act (TSCA) inventory, and a TSCA status line has been added to the RTECS data records of those substances in both files. See paragraph 15 of the Detailed File Description for additional information. Because of the computer matching methods used, there may be some compounds in both files that are not cited with a TSCA status line. As our matching techniques are refined and as the RTECS file and TSCA inventory are updated, additional status lines will be included in future editions of the Registry.

A new edition of the RTECS Tumorigenic, Teratogenic, and Mutagenic Citations Subfiles is now available. See Appendix IV for ordering information.

The RTECS file is updated continuously throughout the year, as both new substances and new data for listed substances are entered. It is important to recognize this changing nature of the Registry whenever any analysis of the substances in the file is undertaken, including those made for regulatory purposes. The reader should also note that although the publication date of this 1979 edition of the Registry is September 1980, the 39,221 substances listed herein are the contents of the RTECS file as of January 1980, and correspond to those contained in the January 1980 RTECS quarterly microfiche issue. Both the RTECS updating program and the length of the publication cycle contribute toward making the annual printed edition of the Registry rapidly outdated. Therefore, in an attempt to provide the most current RTECS data to our users, we continue to produce the Registry quarterly on microfiche and as an on-line data base. See Appendixes VII and VI, respectively, for additional information.

The Editors

EDITORIAL REVIEW BOARD

The RTECS Editorial Review Board was established to serve as a source of advice and technical review for the RTECS data file. The Board consists of representatives from various NIOSH divisions and from other agencies that have a direct interest in the RTECS program. The Board meets periodically to resolve questions of policy and to review current and projected RTECS operations. The Board members are:

Marshall E. LaNier, Director Division of Technical Services	Information Dissemination
Richard J. Lewis, Sr.	**Executive Secretary** **Division of Technical Services**
Rodger L. Tatken	**Technical Secretary** **Division of Technical Services**
John A. Elliott, Ph.D.	**Immunology** **Division of Respiratory Disease Studies**
David H. Groth, M.D.	**Pathology** **Division of Biomedical and Behavioral Science**
Vera W. Hudson	**Ecology** **Division of Criteria Documentation and Standards Development**
Trent R. Lewis, Ph.D.	**Toxicology** **Division of Biomedical and Behavioral Science**
Robert W. Mason, Ph.D.	**Biology** **Division of Biomedical and Behavioral Science**
David P. Sundin	**Hazard Surveillance** **Division of Surveillance, Hazard Evaluations, and Field Studies**
David G. Taylor, Ph.D.	**Analytical Chemistry** **Division of Physical Sciences and Engineering**

ACKNOWLEDGMENTS

NIOSH wishes to thank Jenny Chin-fong Fang, Program Manager for Tracor Jitco, Incorporated, and her staff—Nancy L. Adams, Rodney C. Anderson, Esther J. Asaki, Maclean R. Brown, Jr., James F. Jorkasky, Diana C. Lin, Rodrigue Moise, Dr. Buddha D. Paul, James L. Pennington, Jesus Rimon, Sally W. Snyder, and Alfred P. Sunseri—for their excellent efforts in performing their contract responsibilities for the Registry. The editors also wish to thank Russell L. Hinton, NIOSH Printing Officer; Richard Lutz, Printing Specialist, U.S. Public Health Service; and Michael Miller, MWM Associates, for their advice and assistance in producing this edition of the Registry using the U.S. Government Printing Office photocomposition facilities.

During 1979, we were pleased to receive contributions, suggestions for improvement, and corrections in the content of entries in the Registry from the persons listed below. User participation is potentially far more valuable than staff effort in the collection and evaluation of data in this field. Therefore, in order to improve subsequent editions both in quality and comprehensiveness, participation by all users is strongly encouraged.

Registry of Toxic Effects of Chemical Substances
1979 Edition

INTRODUCTION

The 1979 edition of the Registry of Toxic Effects of Chemical Substances, formerly known as the Toxic Substances List, is the eighth revision prepared in compliance with the requirements of Section 20(a)(6) of the Occupational Safety and Health Act of 1970 (Public Law 91-596). The original list was completed on June 28, 1971, and has been updated annually in book format. Beginning in October 1977, quarterly revisions have been provided in microfiche (see Appendix VII). This Registry contains 145,053 listings of chemical substances: 39,221 are names of different chemicals with their associated toxicity data and 105,832 are synonyms. This edition includes approximately 5,300 new chemical compounds that did not appear in the 1978 Registry.

Statistics about selected data fields in the 1979 Registry are as follows:

Data Type	Number of Compounds	Number of Citations
Tumorigenesis	2,631	4,570
Mutagenesis	940	1,880
Teratogenesis	598	962
Primary Irritation		3,748
Human Toxic Effects		1,475
Chemical Abstracts Service Registry Numbers	28,437	
Federal Standards		1,516
Recommended Standards from NIOSH Criteria Documents		979

The current estimate of the number of unique substances for which toxicity data may be available remains at approximately 100,000. The number of substances and types of toxicity information will be increased in subsequent revisions of the Registry.

The Registry's purposes are many, and it serves a variety of users. It is a single source document for basic toxicity information and for other data, such as chemical identifiers and information necessary for the preparation of safety directives and hazard evaluations for chemical substances. The various types of toxic effects linked to literature citations provide researchers and occupational health scientists with an introduction to the toxicological literature, making their own review of the toxic hazards of a given substance easier. By presenting data on the lowest reported doses that produce effects by several routes of entry in various species, the Registry furnishes valuable information to those responsible for preparing safety data sheets for chemical substances in the workplace. Chemical and production engineers can use the Registry to identify the hazards which may be associated with chemical intermediates in the development of final products, and thus can more readily select substitutes or alternate processes which may be less hazardous. Some organizations, including health agencies and chemical companies, have included the NIOSH Registry accession numbers with the listing of chemicals in their files to reference toxicity information associated with those chemicals. By including foreign language chemical names, a start has been made toward providing rapid identification of substances produced in other countries.

In this edition of the Registry, the editors intend to identify "all known toxic substances" which may exist in the environment and to provide pertinent data on the toxic effects from known doses entering an organism by any route described. Data may be used for the evaluation of chemical hazards in the environment, whether they be in the workplace, recreation area, or living quarters. The data have been assembled in accordance with the definitions and criteria presented below.

In offering this edition, the editors recognize its limitations in achieving the goal that they have set for it. It does not now include all chemicals for which toxic effects have been reported, and will not for some time. This cannot be achieved without the full cooperation of the scientific community. Cooperation in the form of personal contributions will become increasingly imperative as the Registry becomes more nearly complete.

The absence of a substance from the Registry does not imply that the substance is non-toxic, and thus non-hazardous, any more than the

presence of a substance in the Registry indicates that the substance is hazardous in common use. A substance may not appear for a variety of reasons, e.g., (1) the test results could not be cited because the protocol of the study did not meet the RTECS selection criteria, (2) the substance has not yet been tested, or (3) the substance has been tested but the RTECS literature search has not yet uncovered the data.

The Registry includes substances which have been selected primarily for the toxic effect produced by single doses, some lethal and some non-lethal. However, the principal toxic effect of some substances results from exposure over a longer period of time, i.e., from the accumulation of a substance or its metabolites, or from the summation of continuing nonlethal, noxious insults which may eventually disable basic bodily functions. Although these substances are of concern, they may not be found in this edition due to our present selection criteria. However, when the toxic effect has been described by the author as tumorigenic, mutagenic, or teratogenic, even though the effect was produced by repeated exposure, the toxic dose data are reported.

It must be reemphasized that the entry of a substance in the Registry does not automatically mean that it must be avoided. A listing does mean, however, that the substance has the documented potential of being harmful if misused, and care must be exercised to prevent tragic consequences. Thus, the Registry lists many substances that are common in everyday life and are in nearly every household in the United States. One can name a variety of such dangerous substances: prescription and non-prescription drugs; food additives; pesticide concentrates, sprays, and dusts; fungicides; herbicides; paints; glazes; dyes; bleaches and other household cleaning agents; alkalies; and various solvents and diluents. The list is virtually unending because chemicals have become an integral part of our existence.

Drugs, or therapeutic chemicals, have been deliberately included in the Registry if they have been reported to produce a noxious effect. It is reasonable to expect to find such substances listed because they have been developed for their biologic effects. Some drugs achieve the desired effect when administered in a therapeutic quantity by supporting human physiologic activity; others may be beneficial to humans because they are toxic to human parasites. In any case, a quantity greater than the prescribed therapeutic dose may cause undesired toxic effects in humans. For some individuals, the normal therapeutic dose of a drug may produce toxic as well as therapeutic effects. Because drugs may be dangerous, our society has licensed certain practitioners, including physicians, dentists, and pharmacists, to handle the more potent substances intended for human therapeutic use. Similarly, other people are licensed, based on special training, for the handling of pesticides in a safe manner. It is wise to accept the direction of these experts in order to avoid undesirable consequences from misusing chemicals.

Other toxic substances in the environment have appeared there as a result of natural environmental reactions of waste products from our technology, as distinct from the waste products themselves, or from naturally occurring substances. The products of these reactions may be found in the air we breathe and the water we drink. Even though these substances may be present in the environment in concentrations that are non-hazardous by themselves, their toxic potential must not be ignored, especially when additional exposure in the occupational or home environment may occur.

In general, toxic substances that appear in the home and community have been collected, processed, synthesized, packaged, and distributed by someone within the workplace. Some substances may be unwelcome cohabitants of the work environment. The safety and health of individuals in the workplace are the principal concerns of the Occupational Safety and Health Act of 1970. The Act addresses the problem of worker exposure to all toxic substances present in the workplace—not only those in the finished commercial product or in the intermediates used in its production, but also those which occur as waste products resulting from industrial processing.

Toxicity data reported in the literature are transformed into Registry format using the criteria presented in this Introduction and the Detailed File Description. In most cases no attempt is made to resolve any questions about published data. We rely on editing provided by the scientific community prior to publication in the scientific literature. One of the responsibilities of the RTECS Editorial Review Board, however, is to review a limited number of citations to resolve any ambiguities. Citations may be suggested for Board consideration by the data abstractors, the editors, or the Registry readership. The Board will review citations for resolution of ambiguities, but will not judge the relative merits of several publications which present contradictory data on the same substance. The Registry strives to accurately reflect the literature as it exists, leaving to others the problem of grappling with contradictory data.

It is not the purpose of the Registry to quantitate a hazard through the use of the toxic concentration or dose data that are presented with each substance. UNDER NO CIRCUMSTANCE CAN THE TOXIC DOSE VALUES PRESENTED WITH THESE CHEMICAL SUBSTANCES BE CONSIDERED DEFINITIVE VALUES FOR DESCRIBING SAFE VERSUS TOXIC DOSES FOR HUMAN EXPOSURE. Concentrations of chemical substances in the work environment which may be safely tolerated can be determined only by a critical evaluation of all available pertinent data by experienced investigators, data that include but are not limited to that listed in this Registry.

It is important to note the significant difference between classifying toxicity reports and evaluating the potential of a chemical to produce tumorigenic, mutagenic, or teratogenic effects in humans. In classifying reports, the editors of RTECS apply the technical criteria

specified in the Detailed File Description to each report to allow extraction of data on a consistent basis. The evaluation of a substance's toxic potential is much more difficult and requires the collection, review, and analysis of all germane studies. The evidence must be correlated and judged by such parameters as appropriateness of the study to the decision process, relationship of the study design (e.g., animal model, route, and dose levels) to prediction of human response, the balance of positive and negative studies, purity of the substance tested, etc. The Registry makes no attempt to perform such a comprehensive analysis.

A critical evaluation of the hazard of a chemical in the workplace or environment involves much more than a determination of its toxic potency, no matter how complex that determination may be. A hazard evaluation must include such a determination, of course, but toxic potency and degree of hazard are not synonymous. Identifying and defining the hazard of a chemical must also include, among other factors, the evaluation of the amount and duration of exposure, the physical characteristics of the substance, the physical conditions under which exposure occurs, and the evaluation of interactions with other substances that may be present. All of these factors may significantly alter the toxic potency of a substance which, in turn, may alter the health of the person exposed.

The National Institute for Occupational Safety and Health, under its criteria development program, conducts critical reviews of occupational hazards. The resulting criteria document for a particular hazard provides a detailed rationale for the standard recommended by NIOSH to be used by the Department of Labor, Occupational Safety and Health Administration (OSHA) as a basis for a standard. A description of the criteria document program and related NIOSH activities appears in Appendix I.

The permissible exposure levels of hazardous substances which have been adopted by OSHA to provide a safe, healthful work environment for all persons are cited in this Registry under the appropriate compound. These standards may be formulated by the Department of Labor on its own initiative, in response to recommendations of the NIOSH criteria documentation program, or as a result of the Standards Completion Program. Approximately 500 such standards have been promulgated in Part 1910, as amended, of Title 29 of the Code of Federal Regulations (29 CFR 1910). They may also be found in the Federal Register, Volume 39, Number 125, June 27, 1974.

Section 20(a)(6) of the Occupational Safety and Health Act of 1970 directs that the Secretary of Health, Education, and Welfare "...shall determine following a written request by any employer or authorized representative of employees...whether any substance normally found in the place of employment has potentially toxic effects in such concentrations as used or found...." NIOSH responds to this legislative mandate by means of a Health Hazard Evaluation, as specified in 42 CFR 85, first published in the Federal Register, Volume 37, Number 215, pages 23639 through 23642, November 7, 1972. A Health Hazard Evaluation request will secure the assistance of NIOSH in determining the safety of a substance used in a specific occupational environment. Both the Federal Register reference and the request form to be used appear in Appendix III.

The editors request and will appreciate assistance from representatives of the industrial, academic, and governmental communities in supplying data for this Registry. Such assistance may be offered in the form of reprints of scientific publications, technical data sheets, sales or promotional material, other publicly available reference material, and data presented on unpublished studies. All material received will be considered in the public domain and as such may be made available to any persons or organizations. Data cited and published in the Registry will be selected according to the criteria presented herein. Identification of errors in the file is also solicited, as are any general comments or recommendations. Those who have contributed to this year's publication are listed in the Acknowledgments. DETAILED FILE DESCRIPTION

SELECTION

1. Substances Included—For the purpose of this publication, the phrase "all known toxic substances" is interpreted by the editors to mean all mined, manufactured, processed, synthesized, and naturally occurring inorganic and organic compounds. The list of substances includes drugs, food additives, preservatives, ores, pesticides, dyes, detergents, lubricants, soaps, plastics, extracts from plant and animal sources, plants and animals which are toxic by contact or consumption, and industrial intermediates and waste products from production processes. Some of the information in the file thus refers to materials whose composition is not perfectly known. The chemical substances included in this list are assumed to exhibit the reported toxic effect in their pure state unless otherwise noted. However, even in the case of a supposedly "pure" substance, there is usually some degree of uncertainty as to its exact composition and the impurities which may be present. This possibility must be considered in attempting to interpret the data presented since the toxic effects observed could in some cases be caused by a contaminant.

2. Substances Excluded—Excluded from the Registry are trade name products representing compounded or formulated proprietary mixtures available as commercial products. These exclusions are necessary because of difficulties in assessing the contribution of each component of a mixture to that substance's toxicity and because a product's formulation is often changed by varying the components, their concentration, or the purity of the ingredients. Commercial product trade names are included, however, when they represent a single active chemical entity or a well-defined mixture of relatively constant composition. Radioactive substances are included but the effect reported is the chemically produced effect rather than the radiation effect.

FORMAT

This edition of the Registry lists all substance prime names and synonyms in the file in alphabetical order, ignoring special characters such as numerals, Greek letters, and prefixes indicating substituent locations, and stereochemical or other structural features. These components are taken into account for secondary ordering in ascending alphabetical and numerical order.

Each substance prime name is identified by a unique nine-position RTECS accession number (two letters and seven numerals) which varies directly with the alphabetic sequence of the name, so that toluene, for example, has a higher number than benzene. Each synonym is cross-referenced to its appropriate prime name accession number. The accession number is simply an identifier assigned alphabetically to each substance in the Registry. It is not intentionally related to the compound's toxicity or structure, although compounds with alphabetically similar names and, in some cases therefore, similar structures are grouped together.

For each prime name accession number the following data are provided when available: the substance prime name and synonyms; a description of the substance (where necessary); month when the RTECS data record was last updated; CAS number; molecular formula; molecular weight; mutation, primary irritation, and toxic dose data; and citations to aquatic toxicity ratings, IARC reviews, ACGIH Threshold Limit Values, toxicological reviews, existing Federal standards, the NIOSH criteria document program for recommended standards, the NCI Carcinogenesis Testing Program, and the EPA TSCA inventory. Each data line and citation is referenced by CODEN to the source from which the information was abstracted. A complete list of CODEN abbreviations and their respective titles are listed in Volume Two under Bibliographic References. A complete list of standard abbreviations is located on the inside back cover. Sample data records, for the fictitious substance "RTECSIUM," are shown in Figures 1, 2, 3, and 4. Each field in the RTECS data record is discussed below.

1. Substance Prime Name. The prime name of each substance in the Registry is derived from the nomenclature used by the American Chemical Society's Chemical Abstracts Service (CAS) in the 8th Collective Index (8CI) of Chemical Abstracts, which is in the inverted form. The names are modified by NIOSH for certain substances to provide convenience to the user in grouping substances of similar occupational pertinence, such as metallic salts. The complete RTECS data record for each substance follows that substance's prime name.

Some entries, however, appear under the chemical or descriptive names used in the source material from which the toxic data were obtained. This is particularly true for those substances for which some aspects of their composition are in question, such as plant or

7. An acronym which stands for "Mutation Dose."
7a. This is an abbreviation for the mutation test system. See 7a in text.
7b. This is an abbreviation for the test species. For mammalian cell lines, both the parent species and cell type are listed. For host-mediated assays, both the host and indicator organisms are listed. For in vivo studies, the route of administration is also included. See 7b in text.
7c. This is the lowest exposure or dose reported to cause the mutagenic effect. See 7c in text.
10. This is the CODEN denoting the reference from which the mutation data line was derived. The complete citation for this CODEN is listed under Bibliographic References.
10a. The volume number of the reference.
10b. The page number on which the reference starts.
10c. The last two digits of the year of publication, e.g., 75 = 1975.

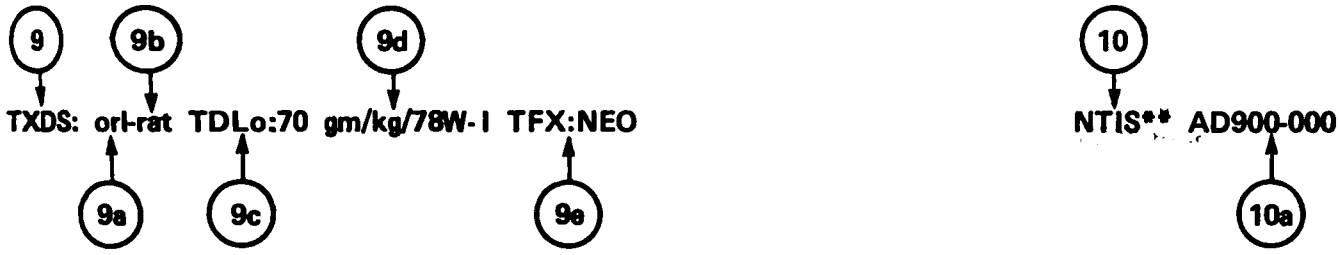
FIGURE 2. A TYPICAL MUTATION LINE FROM THE REGISTRY OF TOXIC EFFECTS OF CHEMICAL SUBSTANCES

(THIS FIGURE IS A FURTHER EXPLANATION OF ITEM 7 in FIGURE 1)

8. An acronym which stands for "Irritation Dose."
8a. This is an abbreviation for the tissue upon which the irritation test was conducted, either skin (skn) or eyes (eye).
8b. This is an abbreviation for the test species. See Table II for other species listed in the Registry.
8c. This is the amount of substance used in the test for which results are reported, and may contain information about duration of exposure if different from the standard time of 72 hours.
8d. This is a descriptor to indicate differences in the test conditions from the standard protocol. Thus, "open" is used with skin irritation data to indicate an open, Draize test. Other descriptors are "imm," "nse," and "rns."
8e. This is an abbreviation to indicate the severity of the irritation response as reported in the reference: mild (MLD), moderate (MOD), or severe (SEV).
10. This is the CODEN denoting the reference from which the irritation data line was derived. The complete citation for this CODEN is listed under Bibliographic References.
10a. The volume number of the reference.
10b. The page number on which the reference starts.
10c. The last two digits of the year of publication, e.g., 54 = 1954.

FIGURE 3. A TYPICAL PRIMARY IRRITATION LINE FROM THE REGISTRY OF TOXIC EFFECTS OF CHEMICAL SUBSTANCES

(THIS FIGURE IS A FURTHER EXPLANATION OF ITEM 8 IN FIGURE 1)



9. An acronym which stands for "Toxic Dose."
9a. This is an abbreviation for the route of administration or entry. See Table I for other routes listed in the Registry.
9b. This is an abbreviation for the test species. See Table II for other species listed in the Registry.
9c. This is the type of dose reported. See 9c in text.
9d. This is the dose reported to cause the toxic effect. See 9d, 9e, and 9f in text.
9e. The first part of this notation, "TFX," is an acronym which stands for "Toxic Effects." The last part of this notation refers to the type of effect caused by the administered dose. See 9g in text.
10. This is the CODEN denoting the reference from which the toxic dose line was derived. The complete citation for this CODEN is listed under Bibliographic References.
10a. The report number of the reference.

FIGURE 4. A TYPICAL TOXIC DOSE LINE FROM THE REGISTRY OF TOXIC EFFECTS OF CHEMICAL SUBSTANCES

(THIS FIGURE IS A FURTHER EXPLANATION OF ITEM 9 IN FIGURE 1)

animal extracts. These prime names are accompanied by a brief description or definition ("DEF") listing the source of the substance, a general statement of constituents, or other pertinent information, and the CODEN citation of the reference that contained the definition.

2. Update ("UPD"). This field specifies when the substance's data record was last changed. The format is YYMM, e.g., 7905 = May 1979. All 33,929 substances in the 1978 printed Registry, which is dated January 1979, were initialized with a date of 7901. When a new substance is first input to the file, the update field is assigned the month of entry. When the data record is subsequently revised, the date is changed to reflect the month the change is made. Note that any revision, for example, deletion of an invalid synonym, addition of new toxicity data, change in the NCI status, or correction of a molecular formula, will cause the substance's update field to change.

3. The Chemical Abstracts Service Registry Number ("CAS") is a numeric designation assigned by the American Chemical Society's Chemical Abstracts Service and uniquely identifies a specific chemical compound. This entry allows one to conclusively identify a substance regardless of the name or naming system used.

4. Molecular Weight ("MW") is calculated from the molecular formula.

5. Molecular Formula ("MOLFM") designates the elemental composition of the substance and is structured according to the Hill System (see Journal of the American Chemical Society, 22(8): 478-494, 1900) in which carbon and hydrogen (if present) are listed first, followed by the other elemental symbols in alphabetical order. The formula for compounds that do not contain carbon are ordered strictly alphabetically by element symbol. Compounds such as salts or those containing waters of hydration have molecular formulas incorporating the CAS dot-disconnect convention, in which the components are listed individually and separated by a period. The individual components of the formula are generally given in order of decreasing carbon atom count, and the component ratios given. A lower case "x" indicates that the ratio is unknown. A lower case "n" indicates a repeating, polymer-like structure. The formula is obtained from one of the cited references or a chemical reference text, or derived from the name of the substance.

6. Synonyms ("SYN") for the substance prime name are listed alphabetically according to the rule described under "FORMAT." Synonyms include other chemical names, trade names, common or generic names, foreign names (with the language in parentheses), or codes, and are separated by asterisks. Some synonyms consist in whole or in part of registered trademarks. These trademarks are not identified as such in the RTECS file because of limitations in the computer and photocomposition character sets used to produce the Registry. The editors are aware of the problem of trademarks becoming generic trade names through common usage. While the Registry does not presently have a mechanism for noting trademarks, the lack of the appropriate registered trademark symbol does not imply that the trademarks contained herein are considered generic synonyms by NIOSH.

7. Mutation Data (see Figure 2). All mutation data for both whole animal and in vitro studies follow the header "MTDS." Each mutation data line includes, in sequence, the mutation test system utilized, the species of the tested organism (and where applicable, the route of administration or cell type), the exposure concentration or dose, and the reference from which the information was extracted. The reader should note that all toxic dose lines (see paragraph 9) that were coded "TFX:MUT" in editions of the Registry prior to October 1979 have been reformatted and are now included as mutation data lines in this section. Only positive mutation test results are cited.

A mutation is defined as any heritable change in genetic material. Unlike irritation and toxic dose data (see paragraphs 8 and 9, respectively), which report the results of whole animal studies, mutation data also include studies on lower organisms such as bacteria, molds, yeasts, and insects, as well as in vitro mammalian cell cultures. Studies of plant mutagenesis are not now included in the Registry. No attempt is made to evaluate the significance of the data or to rate the relative potency of the compound as a mutagenic risk to man.

Each element of the mutation data line is discussed below.

a. Mutation Test System. A number of test systems are used to detect genetic alterations caused by chemical substances. Those systems currently cited in the RTECS file are listed below. Additional ones may be added as they are reported in the literature. Each test system is identified by the 3-letter code shown in parentheses. For additional information about mutation tests, the reader may wish to consult the Handbook of Mutagenicity Test Procedures, edited by B. J. Kilbey, M. Legator, W. Nichols, and C. Ramel (Amsterdam: Elsevier Scientific Publishing Company/North-Holland Biomedical Press, 1977).

(1) Mutation in Microorganisms (mmo) - System utilizes the detection of heritable genetic alterations in microorganisms which have been exposed directly to the chemical substance.

(2) Microsomal Mutagenicity Assay (mma) - System utilizes an in vitro technique which allows enzymatic activation of promutagens in the presence of an indicator organism in which induced mutation frequencies are determined.

(3) Micronucleus Test (mnt) - System utilizes the fact that chromosomes or chromosome fragments may not be incorporated into one or the other of the daughter nuclei during cell division.

(4) Specific Locus Test (slt) - System utilizes a method for detecting and measuring rates of mutation at any or all of several recessive loci.

(5) DNA Damage (dnd) - System detects the damage to DNA strands including strand breaks, crosslinks, and other abnormalities.

(6) DNA Repair (dnr) - System utilizes methods of

monitoring DNA repair as a function of induced genetic damage.

(7) Unscheduled DNA Synthesis (dns) - System detects the synthesis of DNA during usually non-synthetic phases.

(8) Gene Conversion and Mitotic Recombination (mrc) - System utilizes unequal recovery of genetic markers in the region of the exchange during genetic recombination.

(9) Cytogenetic Analysis (cyt) - System utilizes cultured cells or cell lines to assay for chromosomal aberrations following the administration of chemical substances.

(10) Sister Chromatid Exchange (sce) - System detects the interchange of DNA in cytological preparations of metaphase chromosomes between replication products at apparently homologous loci.

(11) Sex Chromosome Loss and Nondisjunction (sln) - System measures the nonseparation of homologous chromosomes at meiosis and mitosis.

(12) Dominant Lethal Test (dlt) - A dominant lethal is a genetic change in a gamete that kills the zygote produced by that gamete. In mammals, the dominant lethal test measures the reduction of litter size. In insects, it measures the number of unhatched eggs.

(13) Mutation in Mammalian Somatic Cells (msc) - System utilizes the induction and isolation of mutants in cultured mammalian cells by identification of the gene change.

(14) Host-Mediated Assay (hma) - System uses two separate species, generally mammalian and bacterial, to detect heritable genetic alteration caused by metabolic conversion of chemical substances administered to host mammalian species in the bacterial indicator species.

(15) Sperm Morphology (spm) - System measures the departure from normal in the appearance of sperm.

(16) Heritable Translocation Test (trn) - Test measures the transmissibility of induced translocations to subsequent generations. In mammals, the test uses sterility and reduced fertility in the progeny of the treated parent. In addition, cytological analysis of the F1 progeny or subsequent progeny of the treated parent is carried out to prove the existence of the induced translocation. In Drosophila, heritable translocations are detected genetically using easily distinguishable phenotypic markers, and these translocations can be verified with cytogenetic techniques.

(17) Oncogenic Transformation (otr) - System utilizes morphological criteria to detect cytological differences between normal and transformed tumorigenic cells.

b. Those test species that are peculiar to mutation data cited in the Registry are designated by the 3-letter codes shown below. Other species are listed in Table II.

	Code	Species
Bacteria:	bcs	Bacillus subtilis
	esc	Escherichia coli
	klp	Klebsiella pneumoniae
	sat	Salmonella typhimurium
	srm	Serratia marcescens
Molds:	asn	Aspergillus nidrlans
	nsc	Neurospora crassa
Yeasts:	smc	Saccharomyces cerevisiae
	ssp	Schizosaccharomyces pombe
Insects:	dmg	Drosophila melanogaster
	dpo	Drosophila pseudo-obscura

If the test organism is a cell type from a mammalian species (see Table II), the parent mammalian species is reported, followed by a colon and the cell type designation. For example, human leukocytes are coded "hmn:leu." The various cell types currently cited in the Registry are listed below.

Designation	Cell Type
bmr	bone marrow
emb	embryo
fbr	fibroblast
hla	HeLa cell
leu	leukocyte
lng	lung
lym	lymphocyte
mmr	mammary gland
ovr	ovary

In the case of host-mediated assays, both the host organism and the indicator organism are given as follows: host organism/indicator organism, e.g., "ham/sat" for a test in which hamsters were exposed to the test chemical and S. typhimurium was used as the indicator organism.

For in vivo mutagenic studies, the route of administration is specified following the species designation, e.g., "mus-orl" for oral administration to mice. See Table I for a complete list of routes cited in the Registry. The route of administration is not specified for in vitro data.

c. Units of Exposure. The lowest dose producing a positive effect is cited. The author's calculations are used to determine the lowest dose at which a positive effect was observed. If the author fails to state the lowest effective dose, the Fisher's Exact Test is applied to the data. A positive effect is taken at the 0.05 level. Ideally, the dose should be reported in universally accepted toxicological units such as milligrams of test chemical per kilogram of test animal body weight. While this is possible in cases where the actual intake of the chemical by an organism of known weight is reported, it is not possible in many systems using insect and bacterial species. In cases where a dose is reported or where the amount can be converted to a dose unit, it is normally listed as milligrams per kilogram (mg/kg). However, micrograms (ug), nanograms (ng), or picograms (pg) per kilogram may also be used for convenience of presentation.

Concentrations of gaseous substances in air are listed as parts per hundred (pph), per million (ppm), per billion (ppb), or per trillion (ppt).

Test systems using microbial organisms traditionally report exposure data as an amount of chemical per liter (L) or amount per plate, well, or disc. The amount may be on a weight (gm, mg, ug, ng, or pg) or molar (millimole (mmol), micromole (umol), nanomole (nmol), or picomole (pmol)) basis. These units describe the exposure concentration rather than the dose actually taken up by the test species. Insufficient data currently exist to permit the development of dose amounts from this information. In such cases, therefore, the substance concentration units used by the author are reported.

Since the exposure values reported in host-mediated assays are the doses delivered to the host organism, no attempt is made to estimate the exposure concentration to the indicator organism. The exposure values cited for host-mediated assay data are in units of milligrams (or other appropriate unit of weight) of substance administered per kilogram of host body weight.

8. Skin and Eye Irritation Data (see Figure 3). All primary irritation data follow the header "IRDS." Each irritation data line includes, in sequence, the tissue tested (skin or eye); the species of animal tested; the total dose and where applicable, the duration of exposure; for skin tests only, whether open or occlusive; an interpretation of the irritation response severity when noted by the author; and the reference from which the information was extracted. Only positive irritation test results are included in the Registry.

Substances that are applied topically to the skin or to the mucous membranes can elicit either (a) systemic effects of an acute or chronic nature or (b) local effects, more properly termed "primary irritation." A primary irritant is a substance that, if present in sufficient quantity for a sufficient period of time, will produce a non-allergic, inflammatory reaction of the skin or of the mucous membrane at the site of contact. Primary irritants are further limited by the editors to those substances that are not corrosive. Hence, concentrated sulfuric acid is not classified as a primary irritant.

a. Primary Skin Irritation. In experimental animals, a primary skin irritant is defined as a chemical substance that produces an irritant response on first exposure in a majority of the test subjects. However, in some instances compounds act more subtly and require either repeated contact or special environmental conditions (humidity, temperature, occlusion, etc.) to produce a response.

The most standard animal irritation test is the Draize procedure (Journal of Pharmacology and Experimental Therapeutics, 82: 377-419, 1944). This procedure has been modified and adopted as a regulatory test by the Consumer Product Safety Commission (CPSC) in 16 CFR 1500.41 (formerly 21 CFR 191.11). In this test a known amount (0.5 ml of a liquid or 0.5 gm of a solid or semisolid) of the test substance is introduced under a one square inch gauze patch. The patch is applied to the skin (clipped free of hair) of twelve albino rabbits. Six rabbits are tested with intact skin and six with abraded skin. The abrasions are minor incisions made through the stratum corneum, but are not sufficiently deep to disturb the dermis or to produce bleeding. The patch is secured in place with adhesive tape, and the entire trunk of the animal is wrapped with an impervious material, such as rubberized cloth, for a 24-hour period. The animal is immobilized during exposure. After 24 hours the patches are removed and the resulting reaction evaluated for erythema, eschar, and edema formation. The reaction is again scored at the end of 72 hours (48 hours after the initial reading), and the two readings are averaged. A substance producing any degree of positive reaction is cited in the Registry as an irritant.

As the modified Draize procedure described above has become the standard test specified by the U.S. government, nearly all of the primary skin irritation data either strictly adheres to the test protocol or involves only simple modifications to it. When test procedures other than those described above are reported in the literature, appropriate codes are included in the data line to indicate those deviations.

The most common modification is the lack of occlusion of the test patch, so that the treated area is left open to the atmosphere. In such cases the notation "open" appears in the irritation data line. Another frequent modification involves whole arm or whole body immersion in the test substance or, more commonly, in a dilute aqueous solution of the test substance. This type of test is often conducted on soap and detergent solutions. Immersion data are identified by the abbreviation "imm" in the data line.

The dose reported is based first on the lowest dose producing an irritant effect and second on the latest study published. The dose is expressed as follows:

(1) Single application by the modified Draize procedure is indicated by only a dose amount. If no exposure time is given, then the data are for the standard 72-hour test. For test times other than 72 hours, the dose data is given in mg (or an appropriate unit)/duration of exposure, e.g., 10 mg/24H.

(2) Multiple applications involve administration of the dose in divided portions applied periodically. The total dose of test substance is expressed in mg (or an appropriate unit)/duration of exposure, with the symbol "I" indicating intermittent exposure, e.g., 5 mg/6D-L

The method of testing substances for primary skin irritation given in the Code of Federal Regulations does not include an interpretation of the response. However, some authors do include a subjective rating of the irritation observed. If such a severity rating is given, it is included in the data line as mild ("MLD"), moderate ("MOD"), or severe ("SEV"). The Draize procedure employs a rating scheme which is included here for informational purposes only, since other researchers may not categorize irritation response in this manner.

Category	Code	Skin Reaction
Mild	MLD	Well defined erythema and slight edema (edges of area well defined by definite raising)

Moderate	MOD	Moderate to severe erythema and moderate edema (area raised approximately 1 mm)
Severe	SEV	Severe erythema (beet redness) to slight eschar formation (injuries in depth) and severe edema (raised more than 1 mm and extending beyond area of exposure)

b. Primary Eye Irritation. In experimental animals, a primary eye irritant is defined as a chemical substance that produces an irritant response in the test subject on first exposure. Eye irritation study procedures developed by Draize have been modified and adopted as a regulatory test by CPSC in 16 CFR 1500.42. In this procedure, a known amount of the test material (0.1 ml of a liquid or 100 mg of a solid or paste) is placed in one eye of each of six albino rabbits; the other eye remains untreated, serving as a control. The eyes are not washed after instillation and are examined at 24, 48, and 72 hours for ocular reaction. After the recording of ocular reaction at 24 hours, any or all eyes may be further examined following the application of fluorescein. Any or all eyes may also be washed with a sodium chloride solution (U.S.P. or equivalent) after the 24-hour reaction has been recorded.

A test is scored positive if any of the following effects are observed: (1) ulceration (besides fine stippling); (2) opacity of the cornea (other than slight dulling of normal luster); (3) inflammation of the iris (other than a slight deepening of the rugae or circumcorneal injection of the blood vessel); (4) swelling of the conjunctiva (excluding the cornea and iris) with eversion of the eyelid; or (5) a diffuse crimson-red color with individual vessels not clearly identifiable. A substance is an eye irritant if four of six rabbits score positive. It is considered a nonirritant if none or only one of six animals exhibits irritation. If intermediate results are obtained, the test is performed again. For the purpose of RTECS, substances producing any degree of irritation in the eye are identified in the Registry as irritants. When an author has designated a substance as either a mild, moderate, or severe eye irritant, this designation is also reported.

The dose reported is based first on the lowest dose producing an irritant effect and second on the latest study published. Single and multiple applications are indicated as described above under "Primary Skin Irritation." Test times other than 72 hours are noted in the dose. All eye irritant test exposures are assumed to be continuous, unless the reference states that the eyes were washed after instillation. In this case, the notation "rns" (rinsed) is included in the data line.

c. Species Exposed. Since Draize procedures for determining both skin and eye irritation specify rabbits as the test species, most of the animal irritation data in the Registry are for rabbits, although any of the species listed in Table II may be used. The editors endeavor to include as much human data as possible, since this information is directly applicable to occupational exposure. Much of this data comes from studies conducted on volunteers (such as for cosmetic or soap ingredients) or from persons accidentally exposed. When an accidental exposure, such as a spill, is cited, the data line includes the abbreviation "nse" (non-standard exposure). In these cases it is often very difficult to determine the precise amount of the substance to which the individual was exposed. Therefore, for accidental exposures an estimate of the concentration or strength of the substance, rather than a total dose amount, is generally provided.

9. Toxicity Data (see Figure 4). All toxicity data follow the header "TXDS." Each toxic dose data line includes, in sequence, the route of exposure; the species of animal studied; the toxicity measure; the amount of substance per body weight or concentration per unit of air volume and, where applicable, the duration of exposure; a descriptive notation of the type of effect reported; and the reference from which the information was extracted. Only positive toxicity test results are cited in this section.

All toxic dose data appearing in the Registry are derived from reports of the toxic effects produced by individual substances. For human data, a toxic effect is defined as any reversible or irreversible noxious effect on the body, any benign or malignant tumor, any teratogenic effect, or any death that has been reported to have resulted from exposure to a substance via any route. For humans, a toxic effect is any effect that was reported in the source reference. There is no qualifying limitation on the duration of exposure or for the quantity or concentration of the substance, nor is there a qualifying limitation on the circumstances that resulted in the exposure. Regardless of the absurdity of the circumstances that were involved in a toxic exposure, it is assumed that the same circumstances could recur. For animal data, toxic effects are limited to the production of tumors, benign (neoplastigenesis) or malignant (carcinogenesis); the production of changes in the offspring resulting from action on the fetus directly (teratogenesis); and death. There is no limitation on either the duration of exposure or on the quantity or concentration of the dose of the substance reported to have caused these effects. Note that reports of in vivo mutagenic effects previously cited in this section are now included under mutation data (see paragraph 7).

The report of the lowest total dose administered over the shortest time to produce the toxic effect was given preference, although some editorial license was taken so that additional references might be cited. No restrictions were placed on the amount of a substance producing death in an experimental animal nor on the time period over which the dose was given. By law, however, a toxic effect must be produced for the dose published. Therefore, terms suggesting that a toxic or lethal effect may exist at doses greater than those tried cannot be used.

Each element of the toxic dose data line is discussed below.

a. Route of Exposure or Administration. Although many exposures to substances in the industrial community occur via the respiratory tract or skin, most studies in the published literature report exposures of experimental animals in which the test substances were introduced primarily through the mouth by pills, in food, in drinking water, or by intubation directly into

the stomach. The abbreviations and definitions of the various routes of exposure reported in the Registry are found in Table I.

b. Species Exposed. Since the effects of exposure of humans are of primary concern, we have indicated, when available, whether the results were observed in man, woman, child, or infant. If no such distinction was made in the reference, the abbreviation "hmn" (human) is used. However, the results of studies on rats or mice are the most frequently reported and hence provide the most useful data for comparative purposes. The species and abbreviations used in reporting toxic dose data are listed alphabetically in Table II.

c. Description of Exposure. In order to better describe the administered dose reported in the literature, six abbreviations are used. These terms indicate whether the dose caused death (LD) or other toxic effects (TD) and whether it was administered as a lethal concentration (LC) or toxic concentration (TC) in the inhaled air. In general, the term "Lo" is used where the number of subjects studied was not a significant number from the population or the calculated percentage of subjects showing an effect was listed as 100. The definition of terms is as follows:

TDLo—Toxic Dose Low—the lowest dose of a substance introduced by any route, other than inhalation, over any given period of time and reported to produce any toxic effect in humans or to produce carcinogenic, neoplastigenic, or teratogenic effects in animals or humans.

TCLo—Toxic Concentration Low—the lowest concentration of a substance in air to which humans or animals have been exposed for any given period of time that has produced any toxic effect in humans or produced a carcinogenic, neoplastigenic, or teratogenic effect in animals or humans.

LDLo—Lethal Dose Low—the lowest dose (other than LD50) of a substance introduced by any route, other than inhalation, over any given period of time in one or more divided portions and reported to have caused death in humans or animals.

LD50—Lethal Dose Fifty—a calculated dose of a substance which is expected to cause the death of 50% of an entire defined experimental animal population. It is determined from the exposure to the substance by any route other than inhalation of a significant number from that population. Other lethal dose percentages, such as LD1, LD10, LD30, and LD99, may be published in the scientific literature for the specific purposes of the author. Such data would be published in the Registry if these figures, in the absence of a calculated lethal dose (LD50), were the lowest found in the literature.

LCLo—Lethal Concentration Low—the lowest concentration of a substance in air, other than LC50, which has been reported to have caused death in humans or animals. The reported concentrations may be entered for periods of exposure which are less than 24 hours (acute) or greater than 24 hours (subacute and chronic).

LC50—Lethal Concentration Fifty—a calculated concentration of a substance in air, exposure to which for a specified length of time is expected to cause the death of 50% of an entire defined experimental animal population. It is determined from the exposure to the substance of a significant number from that population.

The following table summarizes the above information:

Category	Exposure Time	Route of Exposure	TOXIC EFFECTS Human	TOXIC EFFECTS Animal
TDLo	Acute or Chronic	All except Inhalation	Any Non-Lethal	CAR, NEO ETA, TER
TCLo	Acute or Chronic	Inhalation	Any Non-Lethal	CAR, NEO ETA, TER
LDLo	Acute or Chronic	All except Inhalation	Death	Death
LD50	Acute	All except Inhalation	Not Applicable	Death (Statistically Determined)
LCLo	Acute or Chronic	Inhalation	Death	Death
LC50	Acute	Inhalation	Not Applicable	Death (Statistically Determined)

d. Units of Dose Measurement. As in almost all experimental toxicology, the doses given are expressed in terms of the quantity administered per unit body weight, or quantity per skin surface area, or quantity per unit volume of the respired air. In addition, the duration of time over which the dose was administered is also listed, as needed. Dose amounts are generally expressed as milligrams (one thousandth of a gram) per kilogram (mg/kg). In some cases, because of dose size and its practical presentation in the file, grams per kilogram (gm/kg), micrograms (one millionth of a gram) per kilogram (ug/kg), or nanograms (one billionth of a gram) per kilogram (ng/kg) are used. Volume measurements of dose were converted to weight units by appropriate calculations. Densities were obtained from standard reference texts. Where densities were not readily available, all liquids were assumed to have a density of one gram per milliliter. Twenty drops of liquid are assumed to be equal in volume to one milliliter.

All body weights have been converted to kilograms (kg) for uniformity. For those references in which the dose was reported to have been administered to an animal of unspecified weight or a given number of animals in a group (e.g., feeding studies) without weight data, the weights of the respective animal species were assumed to be those listed in Table II and the dose is listed on a per kilogram body weight basis. Assumptions for daily food and water intake are found in Table II to allow approximating doses for humans and species of experimental animals where the dose was originally reported as a concentration in food or water. The values presented are selections which are reasonable for the species and convenient for dose calculations.

Concentrations of a gaseous substance in air are generally listed as parts of vapor or gas per million parts of air by volume (ppm). However, parts per hundred (pph or per cent), parts per billion (ppb), or parts per trillion (ppt) may be used for convenience of presentation. If the substance is a solid or a liquid, the

concentrations are listed preferably as milligrams per cubic meter (mg/m3) but may, as applicable, be listed as micrograms per cubic meter (ug/m3), nanograms per cubic meter (ng/m3), or picograms (one trillionth of a gram) per cubic meter (pg/m3) of air. For those cases in which other measurements of contaminants are used, such as the number of fibers or particles, the measurement is spelled out.

Where the duration of exposure is available, time is presented as minutes (M), hours (H), days (D), weeks (W), or years (Y). Additionally, continuous (C) indicates that the exposure was continuous over the time administered, such as ad libitum feeding studies or 24-hour, 7-day per week inhalation exposures. Intermittent (I) indicates that the dose was administered during discrete periods, such as daily, twice weekly, etc. In all cases, the total duration of exposure appears first after the kilogram body weight and slash, followed by descriptive data; e.g., 10 mg/kg/3W-I means ten milligrams per kilogram body weight administered over a period of three weeks, intermittently in a number of separate, discrete doses. This description is intended to provide the reader with enough information for an approximation of the experimental conditions, which can be further clarified by studying the reference cited.

e. Frequency of Exposure. Frequency of exposure to the test substance varies depending on the nature of the experiment. For the purpose of the Registry, frequency of exposure is given in the case of an inhalation experiment, for human exposures (where applicable), or where CAR, NEO, ETA, or TER is specified as the toxic effect (see paragraph 9g below).

f. Duration of Exposure. For assessment of tumorigenic effect, the testing period should be the life span of the animal, or until statistically valid calculations can be obtained regarding tumor incidence. In the toxic dose line, the total dose causing the tumorigenic effect is given. The duration of exposure is included to give an indication of the testing period during which the animal was exposed to this total dose. For multigenerational studies, the time during gestation when the substance was administered to the mother is also provided.

g. Notations Descriptive of the Toxicology. The toxic dose line thus far has indicated the route of entry, the species involved, the description of the dose, and the amount of the dose. The next entry found on this line when a toxic exposure (TD or TC) has been listed is "TFX" (Toxic Effect). Following "TFX" will be one of the notations found in Table III. These notations indicate the organ system affected or special effects that the substance produced, e.g., TER = teratogenic effect. No attempt was made to be definitive in reporting these effects because such definition requires much detailed qualification and is beyond the scope of the publication at this time. The selection of the dose was based first on the lowest dose producing an effect and second on the latest study published.

The importance attached to reports of the carcinogenic activity of substances necessitates a more detailed discussion of the criteria used to include this type of data in the Registry. Tumorigenic citations are classified according to the reported results of the study only to aid the reader in selecting appropriate references for in-depth review and evaluation. In editions of the Registry prior to 1978, the two classifications used were CAR, indicating a positive carcinogenic finding, and NEO, indicating a study producing benign tumors or one lacking complete documentation. Beginning in October 1978, a third classification, ETA (equivocal tumorigenic agent), was added to denote those studies reporting uncertain, but seemingly positive, results. The criteria for these three classifications are listed below. As explained in the Introduction, these criteria are used to abstract the data in individual reports on a consistent basis and do not represent a comprehensive evaluation of a substance's tumorigenic potential to humans.

Because of the increasing concern with carcinogens in the occupational environment, the Registry now cites multiple studies in which tumorigenic responses were reported. That is, for a given substance, a particular route-species combination may be cited more than once if the results of the multiple studies are coded TFX:CAR, NEO, or ETA. These multiple tumorigen entries have been cited simply with a toxicity measure of TD (toxic dose) or TC (toxic concentration).

The following 9 technical criteria are used by RTECS to abstract the toxicological literature and classify studies that report positive tumorigenic responses. No attempts are made either to evaluate the various test procedures or correlate results from different experiments.

(1) A citation is coded "TFX:CAR" (carcinogenic) when review of an article reveals that all of the following criteria are satisfied:

(a) A statistically significant increase in the incidence of tumors in the test animals. The statistical test is that used by the author. If no statistic is reported, a Fisher's Exact Test is applied with significance at the 0.05 level, unless the author makes a strong case for significance at some other level.

(b) A control group of animals is used and the treated and control animals are maintained under identical conditions.

(c) The sole experimental variable between the groups is the administration or non-administration of the test substance (see (9) below).

(d) The tumors consist of autonomous populations of cells of abnormal cytology capable of invading and destroying normal tissues, or the tumors metastasize as confirmed by histopathology.

(2) A citation is coded "TFX:NEO" (neoplastic) when review of an article reveals that all of the following criteria are satisfied:

(a) A statistically significant increase in the incidence of tumors in the test animals. The statistical test is that used by the author. If no statistic is reported, a Fisher's Exact Test is applied with significance at the 0.05 level, unless the author makes a strong case for significance at some other level.

(b) A control group of animals is used, and the treated and control animals are maintained under identical conditions.

(c) The sole experimental variable between the groups is the administration or non-administration of the test substance (see (9) below).

(d) The tumors consist of cells that closely resemble the tissue of origin, that are not grossly abnormal cytologically, that may compress surrounding tissues,

but that neither invade tissues nor metastasize; or

(e) The tumors produced cannot definitely be classified as either benign or malignant.

(3) A citation is coded "TFX:ETA" (equivocal tumorigenic agent) when some evidence of tumorigenic activity is presented, but one or more of the criteria listed in (1) or (2) above is lacking. Thus, a report with positive pathological findings, but with no mention of control animals, is coded "TFX:ETA." Reports in which the results are not interpretable are not cited in the Registry.

(4) Since an author may make statements or conclusions based on a larger context than that of the particular data reported, papers in which the author's conclusions differ substantially from the evidence presented in the paper are subject to review by the RTECS Editorial Review Board.

(5) All doses except those for transplacental carcinogenesis are reported in RTECS in one of the following formats.

(a) For all routes of administration other than inhalation:

cumulative dose in mg (or appropriate unit)/kg/duration of administration.

Whenever the dose reported in the reference is not in the above units, conversion to this format is made based on the information given in paragraph 9d above. The total cumulative dose is derived from the lowest dose level that produces tumors in the test group.

(b) For inhalation experiments:

concentration in ppm (or mg/m3)/total duration of exposure.

The concentration refers to the lowest concentration that produces tumors.

(6) Transplacental carcinogenic doses are reported in RTECS in one of the following formats.

(a) For all routes of administration other than inhalation:

cumulative dose in mg/kg/(time of administration during pregnancy).

The cumulative dose is derived from the lowest single dose that produces tumors in the offspring. The test chemical is administered to the mother.

(b) For inhalation experiments:

concentration in ppm (or mg/m3)/(time of exposure during pregnancy).

The concentration refers to the lowest concentration that produces tumors in the offspring. The mother is exposed to the test chemical.

(7) For the purposes of RTECS, all test chemicals are reported as pure, unless otherwise stated by the author. This does not rule out the possibility that unknown impurities may have been present.

(8) A mixture of compounds whose test results satisfy the criteria in (1), (2), or (3) above is included if the composition of the mixture can be clearly defined.

(9) For tests involving promoters or initiators, a study is included if the following conditions are satisfied (in addition to the criteria in (1), (2), or (3) above):

(a) The test chemical is applied first, followed by an application of a standard promoter. A positive control group in which the test animals are subjected to the same standard promoter under identical conditions is maintained throughout the duration of the experiment. The data are not used if no mention of positive and negative control groups is made in the reference.

(b) A known carcinogen is first applied as an initiator, followed by application of the test chemical as a promoter. A positive control group in which the test animals are subjected to the same initiator under identical conditions is maintained throughout the duration of the experiment. The data are not used if no mention of positive and negative control groups is made in the reference.

Criteria similar to these were used in past editions of the Registry, but were not published in such detail until 1978. These criteria have evolved over the years since the inception of the Registry. Therefore, it is possible that some of the CAR and NEO citations, especially those added to the file during its early years, may not conform exactly to the above rules. The reader is therefore urged to review for himself the specific tumorigenic references cited in the RTECS. Any incorrect citations should be brought to the attention of the editors at the address given in the Introduction.

Substances with TFX:CAR, NEO, or ETA citations are included as part of the Tumorigenic Citations Index, along with those compounds having IARC reviews and/or NCI status lines. For more information about the latest edition of this Index, see Appendix IV.

10. Cited Reference. The final entry of the mutation, irritation, and toxic dose data lines is the reference from which the information was extracted. All references cited are publicly available. No governmental classified documents have been used for source information. All references have been given a unique six-letter CODEN character code (derived from the American Society for Testing and Materials CODEN for Periodical Titles and the CAS Source Index), which identifies periodicals, serial publications, and individual published works. For those references for which no CODEN was found, the corresponding six-letter code includes asterisks (*) in the last one or two positions following the first four or five letters of an acronym for the publication title. Following the CODEN designation (for most entries) is the number of the volume, followed by a comma; the page number of the first page of the article, followed by a comma; and a two-digit number, indicating the year of publication in this century. When the cited reference is a report, the report number is listed. Where contributors have provided information on their unpublished studies, the CODEN consists of the first three letters of the last name, the initials of the first and middle names, and a number sign (#). The date of the letter supplying the information is listed. All CODEN acronyms are listed in alphabetical order and defined in the Bibliographic References section in Volume Two.

11. Aquatic Toxicity Ratings ("AQTX") were extracted from Water Quality Characteristics of Hazardous Materials by Dr. Roy Hahn, Jr. and Paul Jensen, Texas A&M University, College Station, Texas 77843, 1974. This publication grew out of an extensive literature survey on aquatic pollution. The format of this line is shown in Figure 1. "TLm96" is defined as the concentration that will kill 50% of the exposed organisms within 96 hours. The bioassay may be conducted under static or continuous flow conditions. Because of the lack of test standardization and the wide variety of species investigated, ratings (ranges of toxicities), rather than a single toxic dose, are used to give an indication of the toxicity of substances to aquatic life.

12. Reviews. This section supplies additional information to enable the reader to make knowledgeable evaluations of potential chemical hazards. There are three types of reviews listed: (a) International Agency for Research on Cancer (IARC) monograph reviews, which are published by the United Nations World Health Organization (WHO); (b) Threshold Limit Values, which are recommended limits proposed by the American Conference of Governmental Industrial Hygienists (ACGIH); and (c) general toxicology review articles.

a. Cancer Reviews. In the U.N. International Agency for Research on Cancer (IARC) monographs, information on suspected environmental carcinogens is examined, and summaries of available data with appropriate references are presented. Included in these reviews are synonyms, physical and chemical properties, uses and occurrence, and biological data relevant to the evaluation of carcinogenic risk to humans. The 19 monographs in the series contain an evaluation of approximately 500 substances. Single copies of the individual monographs (specify volume number) can be ordered from WHO Publications Centre USA, 49 Sheridan Avenue, Albany, New York 12210, telephone (518) 436-9686.

The format of the IARC data line is shown in Figure 1. The entry "CARCINOGENIC DETERMINATION" indicates that some carcinogenicity data pertaining to a compound has been reviewed by the IARC committee. The Registry summarizes the committee's conclusion in two words. The first indicates whether the data pertains to humans or to animals. The second word indicates the results of the determination as positive, suspected, indefinite, negative, or no data.

This cancer review reflects only the conclusion of the IARC committee based on the data available for the committee's evaluation. Hence, for some substances there may be disagreement between the IARC determination and the tumorigenicity information in the toxicity data lines.

b. Threshold Limit Value (TLV). The TLV is an ACGIH-recommended upper limit (ceiling) or time-weighted average concentration of a substance to which most workers can be exposed without adverse effect. This concentration may be designated as a ceiling ("CL") or time-weighted average concentration ("TWA"), or as a notation ("SKN"), indicating that even though the air concentration may be below the limit value, significant additional exposure to the skin may be dangerous. The TLV's are taken from Documentation of the Threshold Limit Values for Substances in Workroom Air (third edition), Cincinnati: ACGIH, 1976, or its supplement, or from documentation appearing in ACGIH annual reports.

c. Toxicology Reviews. The entry "TOXICOLOGY REVIEW" indicates that the cited review article has been located in the literature. Each review is identified by its CODEN. These articles discuss one or more facets of the toxicology of the substance or the general class to which the substance belongs. Most of these references do not contain specific dose values that can be cited in the Registry as mutation, irritation, or toxicity data (see paragraphs 7, 8, and 9, respectively) because of the RTECS selection criteria. However, the reviews do provide useful information about the toxicity of the substance or group of related substances. The reader is cautioned that the scope of discussion varies greatly among the reviews. Some articles may contain a complete, detailed description of the toxicity of a substance; others may address only a particular aspect of the toxicity (e.g., effect of a substance on fetal development, or body fluid and tissue levels of a substance found under conditions of poisoning); and others may only list the substance in a general discussion of the toxicity of a class of compounds.

13. Standards and Regulations. This section contains notations indicating that the substance is regulated by an agency of the United States Government. The heading of these lines is "STANDARDS AND REGULATIONS," followed either by "OSHA," "EPA," or "DOT." "OSHA" refers to standards promulgated under Section 6 of the Occupational Safety and Health Act of 1970. "EPA" refers to Worker Protection Standards for Agricultural Pesticides promulgated by the Environmental Protection Agency under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). "DOT" refers to substances regulated for shipment by the Department of Transportation. Because of frequent changes to and litigation of Federal regulations, it is recommended that the reader contact the applicable agency for information about the current standards for a particular substance. Omission of a substance or regulatory notation from the Registry does not imply any relief from regulatory responsibility.

OSHA air contaminant standards are noted with the entry "air" following "OSHA." "TWA" or "CL" refers to either time-weighted average or ceiling value, respectively. For some substances, TWA, CL, and Pk (peak) values are given in the standard. In those cases, all three are listed. Finally, some entries may be followed by the designation "(skin)." This designation indicates that the compound may be absorbed by the skin and, even though the air concentration may be below the standard, significant additional exposure through the skin may be possible.

The entry "(SCP)" following "OSHA" indicates that a draft technical standard has been developed for the substance under the joint NIOSH/OSHA Standards Completion Program. Upon promulgation by OSHA, this draft technical standard fulfills the requirements for a complete standard for the substance as required by Sections 6 and 8 of the Occupational Safety and Health Act (29 CFR 1910.1000). A draft technical standard includes requirements for apprising employees

of all hazards to which they are exposed, acceptable personal protective equipment, engineering control procedures, air sampling and analytical procedures, medical surveillance, and recordkeeping. The letter entry following SCP, for example "(SCP-A)," refers to a specific set of draft standards for a group of compounds that were prepared concurrently. Acceptable methods for sampling and analysis have been developed by NIOSH for many of the substances covered by a draft technical standard. A list of those substances and instructions for obtaining the analytical methods appear in Appendix II.

The information following the DOT notation for a substance has been obtained from the Department of Transportation. This notation indicates (a) the hazard class, (b) the label(s) required, and (c) the proper shipping name(s), as specified for transportation. Except for certain export and import shipments, no person may offer or accept a hazardous material, as defined by the Code of Federal Regulations, Title 49, for transportation in commerce within the United States unless that material is properly classed, described, packaged, marked, labeled, and in the condition for shipment as specified by 49 CFR, Parts 100 to 189. For transportation purposes, a hazardous material means a substance or material which has been determined by the Secretary of Transportation to be capable of posing an unreasonable risk to health, safety, and property when transported in commerce and which has been so designated.

Specific definitions are given for each hazard class addressed in 49 CFR; however, DOT reserves the right to regulate or deregulate materials whether or not they meet these definitions. The basic hazard classes include compressed gases, flammables, oxidizers, corrosives, explosives, radioactive materials, and poisons. Although a material may be designated by only one hazard class, additional hazards may be indicated by adding labels or by using other means directed by DOT.

It is essential, therefore, to know the hazard class of a substance and to use the proper label. Generally, a material meeting the DOT definition of a poison must always be labeled as a poison, regardless of the other labeling requirements to ensure adherence to the prohibition against shipping poisons with foodstuffs.

Specific shipping names are designated for hazardous materials listed in 49 CFR. Because of the presence of many nontechnical names or the use of archaic names for some materials, it is necessary to identify the DOT shipping names. The approved DOT shipping names are included as synonyms of the prime names and are identified by the addition of "(DOT)" to the name.

Substances not specifically identified in 49 CFR and not appearing in the Registry are not necessarily exempt from DOT regulations. The Registry contains only those substances specifically identified in 49 CFR. Generic names or general descriptive names such as "insecticide, liquid" are not included in the Registry. Determination of the correct classification for transportation of materials not specifically identified in 49 CFR is the responsibility of the shipper.

14. Criteria Documents. This entry indicates that a NIOSH criteria document recommending a certain environmental (occupational) exposure has been published for this compound or for a class of compounds to which this substance belongs. Included are the title of the document and the recommended standard. The CODEN citation ("NTIS**") refers to the National Technical Information Service, U.S. Department of Commerce. See Appendix I for a description of the NIOSH criteria document program, a list of completed criteria documents, and instructions for ordering them.

15. Status. This section provides information on the activities of various governmental agencies regarding the substance. There are two types of status lines currently listed: (a) NCI status and (b) EPA TSCA status.

a. An NCI status entry indicates that the substance has been or is being tested by the National Cancer Institute (NCI) under its Carcinogenesis Testing Program. The following five different citations are used to reflect the current test status of the compound: selected for test, undergoing test, test results incomplete, test completed, or report available. These citations are updated as each bioassay progresses. Note that selection of a chemical for bioassay does not necessarily imply that it is a carcinogen, and that a compound originally scheduled for bioassay may be withdrawn from the NCI program before testing actually begins. This initial selection is cited in the Registry but is deleted when the compound is removed from the test. It is therefore important that the reader monitor the NCI status lines for changes. When the final report is released, the report number and test results are listed, and, where applicable, specific toxic dose lines (see paragraph 9) are generated. Also, some substances may be selected by NCI for retest after the bioassay is completed and the final report issued. These duplicate studies are noted on a separate NCI status line. To obtain additional information about the NCI Testing Program or the status of a particular substance under test, or to obtain copies of the final bioassay reports, contact the Technical Information Resources Branch, Carcinogenesis Testing Program, National Cancer Institute, Landow Building, Room A306, National Institutes of Health, Bethesda, Maryland 20014, telephone (301) 496-1152.

b. An EPA TSCA status entry indicates that the substance appears on the chemical inventory prepared by the Environmental Protection Agency in accordance with provisions of the Toxic Substances Control Act (TSCA). Substances reported in the inventory include those that are produced commercially in or imported into this country. The reader should note, however, that substances already regulated by EPA under FIFRA and by the Food and Drug Administration under the Food, Drug, and Cosmetic Act, as amended, are not included in the TSCA inventory. Similarly, alcohol, tobacco, and explosive substances are not regulated under TSCA. TSCA regulations should be consulted for an exact definition of reporting requirements. For additional information about TSCA, contact EPA, Office of Toxic Substances, Washington, D.C. 20402. Specific questions about the inventory can be directed to the EPA Office of Industry Assistance, telephone (800) 424-9065.

TABLE I

ROUTES OF ADMINISTRATION TO, OR EXPOSURE OF, ANIMAL SPECIES TO TOXIC SUBSTANCES

Route	Abbreviation	Definition
Eyes	eye	Administration directly onto the surface of the eye. Used exclusively for primary irritation data. See Ocular
Intraarterial	iat	Administration into the artery
Intraaural	ial	Administration into the ear
Intracerebral	ice	Administration into the cerebrum
Intracervical	icv	Administration into the cervix
Intradermal	idr	Administration within the dermis by hypodermic needle
Intraduodenal	idu	Administration into the duodenum
Inhalation	ihl	Inhalation in chamber, by cannulation, or through mask
Implant	imp	Placed surgically within the body — location described in reference
Intramuscular	ims	Administration into the muscle by hypodermic needle
Intraplacental	ipc	Administration into the placenta
Intrapleural	ipl	Administration into the pleural cavity by hypodermic needle
Intraperitoneal	ipr	Administration into the peritoneal cavity
Intrarenal	irn	Administration into the kidney
Intraspinal	isp	Administration into the spinal canal
Intratracheal	itr	Administration into the trachea
Intravaginal	ivg	Administration into the vagina
Intravenous	ivn	Administration directly into the vein by hypodermic needle
Multiple	mul	Administration into a single animal by more than one route
Ocular	ocu	Administration directly onto the surface of the eye or into the conjunctival sac. Used exclusively for systemic toxicity data
Oral	orl	Per os, intragastric, feeding, or introduction with drinking water
Parenteral	par	Administration into the body through the skin. Reference cited is not specific concerning the route used. Could be ipr, scu, ivn, ipl, ims, irn, or ice
Rectal	rec	Administration into the rectum or colon in the form of enema or suppository
Skin	skn	Application directly onto the skin, either intact or abraded. Used for both systemic toxicity and primary irritant effects
Subcutaneous	scu	Administration under the skin
Unreported	unk	Dose, but not route, is specified in the reference

TABLE II

SPECIES

With Assumptions For Toxic Dose Calculation From Non-Specific Data*

Species	Abbrev.	Age	Weight	Consumption (Approx.) Food gm/day	Water ml/day	1 ppm in Food Equals, in mg/kg/D
Bird — any domestic or laboratory bird reported but not otherwise identified	brd		1 kg			
Bird — wild bird species	bwd		40 gm			
Cat, adult	cat		2 kg	100	100	0.05
Cattle, Horse	ctl		500 kg	10,000		0.02
Chicken, adult (male or female)	ckn	8 W	800 gm	140	200	0.175
Child	chd	1-13 Y	20 kg			
Dog, adult	dog	52 W	10 kg	250	500	0.025
Domestic animals — goat, sheep	dom		60 kg	2,400		0.04
Duck, adult (domestic)	dck	8 W	2,500 gm	250	500	0.1
Frog, adult	frg		33 gm			
Gerbil	grb		100 gm	5	5	0.05
Guinea pig, adult	gpg		500 gm	30	85	0.06
Hamster	ham	14 W	125 gm	15	85	0.12
Human	hmn	Adult	70 kg			
Infant	inf	0-1 Y	5 kg			
Mammal — species unspecified in reference	mam		200 gm			
Man	man	Adult	70 kg			
Monkey	mky	2.5 Y	5 kg	250	500	0.05
Mouse	mus	8 W	25 gm	3	5	0.12
Pig	pig		60 kg	2,400		0.041
Pigeon	pgn	8 W	500 gm			
Quail (laboratory)	qal		100 gm			
Rabbit, adult	rbt	12 W	2 kg	60	330	0.03
Rat, adult female	rat	14 W	200 gm	10	20	0.05
Rat, adult male	rat	14 W	250 gm	15	25	0.06
Rat, adult, sex unspecified	rat	14 W	200 gm	15	25	
Rat, weanling	rat	3 W	50 gm	15	25	0.3
Squirrel	sql		500 gm			
Toad	tod		100 gm			
Turkey	trk	18 W	5 kg			
Woman	wmn	Adult	50 kg			

*NOTE: Values given here are within reasonable limits usually found in the published literature and are selected to facilitate calculations for data from publications in which toxic dose information has not been presented for an individual animal of the study. See, for example, Association of Food and Drug Officials, Quarterly Bulletin, volume 18, page 66, 1954, and Guyton, American Journal of Physiology, volume 150, page 75, 1947. Data for lifetime exposure are calculated from the assumptions for adult animals for the entire period of exposure. For definitive dose data, the reader must review the referenced publication.

TABLE III

NOTATIONS DESCRIPTIVE OF THE TOXICOLOGY

Abbreviation	Definition (not limited to effects listed)
ALR	Allergic systemic reaction such as might be experienced by individuals sensitized to penicillin.
BCM	Blood clotting mechanism effects — any effect which increases or decreases clotting time.
BLD	Blood effects — effect on all blood elements, electrolytes, pH, protein, oxygen carrying or releasing capacity.
BPR	Blood pressure effects — any effect which increases or decreases any aspect of blood pressure.
CAR	Carcinogenic effects — see paragraph 9g in text.
CNS	Central nervous system effects — includes effects such as headaches, tremor, drowsiness, convulsions, hypnosis, anesthesia.
COR	Corrosive effects — burns, desquamation.
CUM	Cumulative effects — where substance is retained by the body in greater quantities than is excreted, or the effect is increased in severity by repeated body insult.
CVS	Cardiovascular effects — such as an increase or decrease in the heart activity through effect on ventricle or auricle; fibrillation; constriction or dilation of the arterial or venous system.
DDP	Drug dependence effects — any indication of addiction or dependence.
ETA	Equivocal tumorigenic agent — see paragraph 9g in text.
EYE	Eye effects — irritation, diplopia, cataracts, eye ground, blindness by affecting the eye or the optic nerve.
GIT	Gastrointestinal tract effects — diarrhea, constipation, ulceration.
GLN	Glandular effects — any effect on the endocrine glandular system.
IRR	Irritant effects — any irritant effect on the skin, eye, or mucous membrane.
MLD	Mild irritation effects — used exclusively for primary irritation data.
MMI	Mucous membrane effects — irritation, hyperplasia, changes in ciliary activity.
MOD	Moderate irritation effects — used exclusively for primary irritation data.
MSK	Musculo-skeletal effects — such as osteoporosis, muscular degeneration.
NEO	Neoplastic effects — see paragraph 9g in text.
PNS	Peripheral nervous system effects.
PSY	Psychotropic effects — exerting an effect upon the mind.
PUL	Pulmonary system effects — effects on respiration and respiratory pathology.
RBC	Red blood cell effects — includes the several anemias.
SEV	Severe irritation effects — used exclusively for primary irritation data.
SKN	Skin effects — such as erythema, rash, sensitization of skin, petechial hemorrhage.
SYS	Systemic effects — effects on the metabolic and excretory function of the liver or kidneys.
TER	Teratogenic effects — nontransmissible changes produced in the offspring.
UNS	Unspecified effects — the toxic effects were unspecific in the reference.
WBC	White blood cell effects — effects on any of the cellular units other than erythrocytes, including any change in number or form.

AP8500000 ACETYL PEROXIDE
UPDT:7908 CAS: 110-22-5 MW: 118.10 MOLFM: C4-H6-O4
SYN: DIACETYL PEROXIDE
IRDS: eye-rbt 60 mg/1M rns SEV ZAARAM 8,25,58
TXDS: unk-mus TD_{Lo}:283 mg/kg TFX:ETA RARSAM 3,193,63
STATUS: REPORTED IN EPA TSCA INVENTORY, JULY 1979

AP8550000 ACETYL PEROXIDE (solution)
DEF:Solution contains not over 25% ACETYL PEROXIDE (FEREAC 41,15972,76)
UPDT:7901
SYN: ACETYL PEROXIDE SOLUTION (DOT) * DIACETYL PEROXIDE (solution)
REGS: DOT-ORGANIC PEROXIDE, LABEL:ORGANIC PEROXIDE FEREAC 41,57018,76
