Plant #17

April 14, 1967

Mr. Daniel P. Maloney
Plant Manager
Certain-Feed Products Corp.
St. Louis, Missouri

Dear Mr. Maloney:

The analysis of the air samples collected in your plant during our survey in December 1965 has been completed and the results are attached. The impinger samples were counted during the survey using the American Conference of Governmental Industrial Hygienists' method. The membrane filters were rendered transparent with a 50-50 mixture of diethyl oxalate, dimethyl phthalate and counted at 430X magnification with phase contrast illumination.

All of the dust concentrations as measured by impinger were under the 5 million particles per cubic foot Threshold Limit Value currently in use. The membrane filter method is experimental and no standards have been set for its interpretation. Some relationships between the impinger and filter measurement are discussed in the enclosed reprint.

Your cooperation in this study is sincerely appreciated and the data gained from your plant is of considerable value.

Sincerely yours,

Jeremiah B. Lynch

16. Abstract (Limit: 200 words) Air samples were analyzed at Certain-Teed Products Corporation (SIC-3292) in the St. Louis, Missouri, in December, 1965. Personal samples were taken by membrane filter, and breathing zone and general air samples were taken by impinger. Impinger results ranged from 0.1 million particles of dust per cubic foot (mppcf) in the pipe finishing operation to 3.7mppcf at the grinder location in warehouse and mixing. Membrane filters concentrations ranged from a total of 0.2 fibers per cubic centimeter (f/cc) in pipe finishing to 120.8f/cc at a fiberman location in warehouse and mixing. Other operations monitored included pipe forming, curing, coupling finishing, expoxy, and miscellaneous. All dust concentrations measured by impinger were lower than the 5mppcf threshold limit value.
