

SUPPLEMENTARY FIGURE 2. Estimates of the number of congenital rubella syndrome cases per 100,000 live births during 2012-2024 and the percentage of live births for each region occurring in countries that had introduced rubella-containing vaccine.*†

*The error bars show the 95% range confidence interval.

† Estimates for the Western Pacific region are shown both with and without China to account for the influence of the large population on the population-weighted CRS incidence, to allow for comparison, and for consistency with prior global burden of CRS estimates.

Abbreviation: CRS = congenital rubella syndrome; RCV = rubella-containing vaccine.
