

### Supplement Figure 3.

Supplement Figure 3. DAA treatment effect on HIV & HCV viral load trajectory for persons with HIV/HCV coinfections, the HIV Outpatient Study, 2010-2020

Note: Index date refers to date of DAA prescription for DAA-treated group and propensity score matched pseudo date of DAA prescription for DAA-naïve group, respectively. Probability of detectable viral load refers to proportion of viral load tests with count above the low limit of the respective lab tests. Prior to index date HCV viral load were similar among all patients, after index date detectable viral load for DAA-treated group quickly dropped while DAA-naïve group remain the same level. HIV viral load was not affected by DAA treatment.
