2012

Assisted Reproductive Technology

Fertility Clinic Success Rates Report

August 2014

Acknowledgments

The Centers for Disease Control and Prevention, the Society for Assisted Reproductive Technology, and the American Society for Reproductive Medicine thank RESOLVE: The National Infertility Association and The American Fertility Association for their commitment to assisted reproductive technology (ART) surveillance. Their assistance in making this report informative and helpful to people considering an ART procedure is greatly appreciated. Appendix D has current contact information for these national consumer organizations.

This publication was developed and produced by the National Center for Chronic Disease Prevention and Health Promotion of the Centers for Disease Control and Prevention in consultation with the American Society for Reproductive Medicine and the Society for Assisted Reproductive Technology.

Preface

For many people who want to start a family, the dream of having a child is not easily realized; about 12% of women of childbearing age in the United States have used an infertility service. Assisted reproductive technology (ART) has been used in the United States since 1981 to help women become pregnant, most commonly through the transfer of fertilized human eggs into a woman's uterus. However, for many people, deciding whether to undergo this expensive and time-consuming treatment can be difficult.

The goal of this report is to help potential ART users make informed decisions about ART by providing some of the information needed to answer the following questions:

- What are my chances of having a child by using ART?
- Where can I go to get this treatment?

The Society for Assisted Reproductive Technology (SART), an organization of ART providers affiliated with the American Society for Reproductive Medicine (ASRM), has been collecting data and publishing annual reports of pregnancy success rates for fertility clinics in the United States and Canada since 1989. In 1992, the US Congress passed the Fertility Clinic Success Rate and Certification Act. This law requires the Centers for Disease Control and Prevention (CDC) to publish pregnancy success rates for ART in fertility clinics in the United States. (For more details about the law, see <http://www.cdc.gov/art/Policy.htm>.) Since 1995, CDC has worked in consultation with SART and ASRM to report ART success rates.

The 2012 report of pregnancy success rates is the eighteenth to be issued under the law. This report is based on the latest available data on the type, number, and outcome of ART cycles performed in US clinics.

The 2012 ART report has three major sections:

- ***Commonly Asked Questions About the US ART Clinic Reporting System***

This section provides background information on infertility and ART and an explanation of the data collection, analysis, and publication processes.

- ***Fertility Clinic Tables***

Many factors contribute to the success of ART, including the training and experience of the ART clinic and laboratory professionals, the quality of services, and the characteristics of the patient population. The Fertility Clinic Tables section displays ART results and success rates for individual US fertility clinics in 2012. The section also includes the 2012 National Summary table, which combines data from all clinics.

- ***Appendixes***

Appendix A provides information about 2012 data validation activities.

Appendix B provides definitions for technical and medical terms used throughout the report.

Appendix C includes the current names and addresses of all reporting clinics along with a list of clinics known to be in operation in 2012 that did not report their data to CDC as required by law.

Appendix D includes the names and addresses of national consumer organizations that offer support to people experiencing infertility.

Success rates can be reported in a variety of ways, and the statistical aspects of these rates can be difficult to interpret. This report is intended for the general public, and the emphasis is on presenting the information in an easily understandable form. CDC hopes that this report is informative and helpful to people considering an ART procedure. We welcome any suggestions for improving the report and making it easier to use. (Please contact us at cdcinfo@cdc.gov [Subject: ART].)

In addition to the *2012 Assisted Reproductive Technology Fertility Clinic Success Rates Report*, CDC also publishes the *2012 Assisted Reproductive Technology National Summary Report* (available in December 2014), which provides an overall national picture that uses 2012 data to answer specific questions related to ART success rates.

Commonly Asked Questions About the US ART Clinic Reporting System

Background Information, Data Collection Methods, Content and Design of the Report, and Additional Information About ART in the United States

1. How many people in the United States have infertility problems?

The latest data on infertility available to the Centers for Disease Control and Prevention (CDC) are from the 2006–2010 National Survey of Family Growth. (For more details about the data, see http://www.cdc.gov/nchs/nsfg/key_statistics/i.htm#infertility).

- Of the approximately 62 million women aged 15–44 years in 2010, about 7.4 million, or 12%, had received infertility services at some time in their lives. (Infertility services include medical tests to diagnose infertility, medical advice and treatments to help a woman become pregnant, and services other than routine prenatal care to prevent miscarriage.)
- Additionally, 1.5 million married women aged 15–44 years are infertile (unable to get pregnant after at least 12 consecutive months of trying to conceive).

2. What is assisted reproductive technology (ART)?

Although various definitions have been used for ART, the definition used in this report is based on the 1992 law that requires CDC to publish this report. According to this definition, ART includes all fertility treatments in which either eggs or embryos are handled. In general, ART procedures involve surgically removing eggs from a woman's ovaries, combining them with sperm in the laboratory, and returning them to the woman's body or donating them to another woman. They do NOT include treatments in which only sperm are handled (i.e., intrauterine insemination) or procedures in which a woman takes drugs only to stimulate egg production without the intention of having eggs surgically retrieved.

The main type of ART is **in vitro fertilization (IVF)**. IVF involves extracting a woman's eggs, fertilizing the eggs in the laboratory, and then transferring the resulting embryos into the woman's uterus through the cervix. For some IVF procedures, fertilization involves a specialized technique known as intracytoplasmic sperm injection (ICSI). In ICSI, a single sperm is injected directly into the woman's egg.

Other types of ART exist, but are rarely performed. **Gamete intrafallopian transfer (GIFT)** involves using a fiber optic instrument called a laparoscope to guide the transfer of unfertilized eggs and sperm (gametes) into the woman's fallopian tubes through small incisions in her abdomen. **Zygote intrafallopian transfer (ZIFT)** involves fertilizing a woman's eggs in the laboratory and then using a laparoscope to guide the transfer of the fertilized eggs (zygotes) into her fallopian tubes.

In addition, ART often is categorized according to whether the procedure used a woman's own eggs (nondonor) or eggs from another woman (donor) and according to whether the embryos used were newly fertilized (fresh) or previously fertilized, frozen, and then thawed (frozen).

3. What is an ART cycle?

Because ART consists of several steps over an interval of approximately 2 weeks, an ART procedure is typically referred to as a **cycle** of treatment rather than a procedure at a single point in time. The start of an ART cycle is when a woman begins taking drugs to stimulate egg production or starts ovarian monitoring with the intent of having embryos transferred. For the purposes of this report, data on **all cycles that were started**, even those that were discontinued before all steps were undertaken, are counted in the clinic's success rates.

4. How do US ART clinics report data to CDC about their success rates?

CDC contracts with a statistical survey research organization, Westat, to obtain the data published in the *Fertility Clinic Success Rates Report*. Westat maintains a list of all ART clinics known to be in operation, identifies new clinics throughout the year, and tracks clinic reorganizations and closings. This list includes clinics and individual providers that are members of the Society for Assisted Reproductive Technology (SART) as well as clinics and providers that are not SART members. Westat maintains the National ART Surveillance System (NASS), the Web-based data collection system that all ART clinics use to submit data to CDC. Clinics either electronically enter or import data into NASS for each ART cycle started in a given reporting year. SART-member clinics can report directly to SART, and SART submits the data to NASS. The data collected include information on the client's medical history (such as infertility diagnoses), clinical information pertaining to the ART procedure, and information on resulting pregnancies and births.

5. Why is the report of 2012 success rates being published in 2014?

Before success rates based on live births can be calculated, every ART pregnancy must be followed up to determine whether a birth occurred. Therefore, the earliest possible date that clinics can report complete annual data is late in the year after ART treatment was initiated (about 9 months past year-end, when all the births have occurred). Accordingly, the results of all the cycles initiated in 2012 were not known until October 2013. After ART outcomes are known, the following occurs before the report is published:

- Clinics enter their 2012 data into NASS and verify the data's accuracy before submitting the data at the end of 2013 to Westat.
- Westat compiles a national data set in the beginning of 2014 from the data submitted by individual clinics.
- CDC data analysts conduct comprehensive checks of the numbers reported for every clinic.
- Individual fertility clinic tables are available in the spring of 2014 on CDC's Web site at <http://www.cdc.gov/art/ARTReports.htm>.
- Clinic tables and accompanying text for both the printed and electronic versions of the full report are compiled and laid out.
- Necessary changes are incorporated and proofread.
- The report is submitted to the Government Printing Office to begin the printing and production process.

These steps are time-consuming but essential for ensuring that the report provides the public with correct information particularly regarding each clinic's success rates.

6. Which clinics are represented in this report?

The data in this report come from 456 fertility clinics that provided and verified information about the outcomes of the ART cycles started in their clinics in 2012.

Although almost all clinics that provided ART services in the United States during 2012 are represented in this report, data from 30 clinics or practitioners are not included because they did not report as required. Clinics and practitioners known to have been in operation as of January 1, 2012, that did not report and verify their data are listed in this report as nonreporters, as required by law (see Appendix C: Nonreporting ART Clinics for 2012, by State on pages 563–564). Given the estimated number of ART cycles performed in nonreporting clinics, we estimate that ART surveillance covered 98% of ART cycles performed in the United States in 2012. We will continue to make every effort to include in future reports all clinics and practitioners providing ART services.

7. Why aren't the clinics ranked by their success rates?

Many factors contribute to the success rate of an ART procedure in particular patients, and a difference in success rates between two ART clinics may reflect differences in the groups of patients treated, the types of procedures performed, or other factors. More explanations on how to use the success rates and other statistics published in this report are in the Introduction to Fertility Clinic Tables section (see pages 11–22). The report should be used to help people considering an ART procedure find clinics where they can meet personally with ART providers to discuss their specific medical situation and their likelihood of success using ART. Contacting a clinic also may provide additional information that could be helpful in deciding whether or not to use ART. Because ART offers several treatment options for infertility, there are many other factors that may affect the decision. This report may be a helpful starting point for consumers to obtain information and consider their options.

8. Does this report include all ART cycles performed by the reporting clinics?

This report includes 176,247 ART cycles performed in 2012 by the 456 clinics that reported their data as required. Of those 176,247 cycles, 18,585 were cycles started with the intent of cryopreserving (freezing and banking) all resulting eggs/embryos for potential future use. However, because these cycles did not result in an embryo transfer, they are not included in the majority of clinic success rates and are shown for each clinic in their table as part of the total number of cycles performed. The 176,247 total cycles performed in 2012 excludes 27 cycles started in which a new treatment procedure was being evaluated. The number of new treatment procedures performed is shown for each clinic in footnote "e" of their table.

9. How are the success rates determined?

This report presents several measures of success for ART, including the percentage of ART cycles that result in a pregnancy. (Please note that not all pregnancies result in live birth; some pregnancies may result in miscarriage, induced abortion, or stillbirth.) All live-birth deliveries were reported to the ART clinic by either the patient or the patient's obstetric provider. Because this report is geared toward patients, the focus is on the percentage of cycles resulting in live births. Singleton live births

are emphasized as a separate measure of success because they have a much lower risk than multiple-infant births for adverse infant health outcomes, including prematurity, low birth weight, disability, and death. Success rates additionally were calculated at various steps of the ART cycle to provide a complete picture of the chances for success as the cycle progresses.

10. What are my chances of getting pregnant using ART?

Many consumers ask this question because they assume that the pregnancy will lead to a live birth. Unfortunately, not all ART procedures that result in a pregnancy lead to the delivery of a live infant. For example, 99,665 fresh nondonor ART cycles were started in 2012. Of those, 35,840 (36%) led to a pregnancy, but only 29,307 (29%) resulted in a live birth. In other words, 6,533 (almost 1 in 5) of ART pregnancies did not result in a live birth. The percentage of cycles resulting in live births will give a more accurate answer to the question, “If I have an ART procedure, what is my chance that I will have a baby?”

It is important to note that ART success rates vary in the context of patient and treatment characteristics. These characteristics include age, infertility diagnosis, number of embryos transferred, type of ART procedure, use of techniques such as ICSI, and history of previous births, miscarriages, and ART cycles.

11. If a patient has had more than one ART treatment cycle, how is the success rate calculated? Alternatively, how many cycles does a patient usually go through before getting pregnant?

As required by law, this report presents ART success rates in terms of how many cycles were started each year. Because clinics report information based on outcomes for each cycle started, success rates on a “per patient” basis, or the number of cycles that an average patient may undergo before achieving success, are not presented in this report. While it is possible to achieve success with one ART cycle, success rates vary in the context of patient and treatment characteristics. Consumers should consult with their physician to understand their specific medical situation and their chances of pregnancy using ART.

12. What quality control steps are used to ensure data accuracy?

To have their success rates published in this annual report, clinics have to submit their data in time for analysis and the clinics’ medical directors have to verify by signature that the tabulated success rates are accurate. Then, Westat conducts an in-house review and contacts the clinics if corrections are necessary. After the data have been verified, a quality control process called validation begins. This year, 35 (7.7%) of the 456 reporting clinics were selected after taking into consideration some cycle and clinic characteristics and whether the clinic had been selected before. (See Appendix A: Technical Notes on page 513 for a more detailed presentation of sampling strategy.) Members of the Westat Validation Team visit these clinics and review medical record data for a sample of the clinic’s ART cycles. For each cycle, the validation team abstracts information from the patient’s medical record. The abstracted information is then reviewed onsite and compared with the data submitted for the report. The data validation process does not include any assessment of clinical practice or overall record keeping. Validation primarily helps ensure that clinics submit accurate data. It also serves to identify any systematic problems that could cause data collection to be inconsistent or incomplete. Findings and discrepancy rates from the 2012 validation visits will be available on the CDC Web site later this year at <http://www.cdc.gov/art/ARTReports.htm>.

13. How does CDC use the variables/data collected but not reported in the annual *Assisted Reproductive Technology Fertility Clinic Success Rates Report* and *National Summary Report*?

CDC uses the data collected and not reported in the annual ART reports to evaluate emerging ART research questions and to monitor safety and efficacy issues related to ART treatment for improving maternal and child health outcomes. A list of ART publications is available at <http://www.cdc.gov/art/pubs.htm>. Other data may not be released in order to protect the ART patient's confidentiality. However, CDC has established a way that researchers outside of CDC can securely access limited, de-identified NASS data to conduct analyses. CDC's Research Data Center, housed within the National Center for Health Statistics, allows researchers to analyze restricted data in a secure environment after their proposed research has been reviewed and approved by CDC.

14. How does CDC ensure the confidentiality of the ART data it collects?

CDC has an Assurance of Confidentiality for the ART database. An Assurance of Confidentiality is a formal confidentiality protection authorized under Section 308(d) of the Public Health Service Act (42 U.S.C. 242[m]). An assurance is used for projects conducted by CDC staff or contractors involving the collection or maintenance of sensitive identifiable or potentially identifiable information. The assurance allows CDC programs to assure that individuals and institutions involved in research or nonresearch projects protect the confidentiality of the data collected. Under Public Health Service Act Section 308(d), no identifiable information may be used for any purpose other than that for which it was supplied unless such institution or individual has consented to that disclosure. CDC's current Assurance of Confidentiality for this project is ongoing.

15. Why doesn't the report contain specific medical information about ART?

This report describes a woman's average chances of success per ART cycle. Although the report provides some information about factors such as age and infertility diagnosis, consumers face many unique medical situations. This population-based registry of ART procedures cannot capture detailed information about specific medical conditions associated with infertility. Consumers should consult with their physician to understand their specific medical situation and their chances of success using ART.

16. Why are statistics in the Fertility Clinic Tables published by CDC different from statistics reported by SART's IVF Success Rate Reports?

During 1996–2012, the percentage of ART clinics with a SART membership reporting data to CDC ranged from approximately 83% to 95%. Annual summary statistics of ART treatments performed in each of these clinics are available online at <http://www.sart.org>. For the same table items that are presented in both the CDC's Fertility Clinic Tables and SART's IVF Success Rate Reports, discrepancies in tabulated statistics between the SART and CDC tables may be due to (1) the inclusion in the CDC Fertility Clinic Reports of ART treatments performed at non-SART member clinics; (2) differences in the data submission deadlines between SART and CDC, which may result in ART clinics being excluded from CDC's annual Fertility Clinic Reports; and (3) differences in data processing procedures and statistical methods used to generate statistics.

17. Does CDC have any information on the women who donate eggs?

CDC only collects information on the age of egg donors, but does not present it in the individual clinic tables for this report. In 2012, the average age of egg donors was approximately 28 years. Success rates for cycles using donor eggs or using embryos derived from donor eggs is related to the age of the woman who produced the eggs. Thus, the percentage of transfers that resulted in live births for cycles using fresh embryos from donor eggs remained consistently high—above 55% among most patients of different ages.

18. Are there any medical guidelines for ART performed in the United States?

The American Society for Reproductive Medicine (ASRM) and the Society of Assisted Reproductive Technology (SART) issue guidelines dealing with specific ART practice issues, such as the number of embryos to be transferred in an ART procedure. Further information can be obtained from ASRM or SART (both at telephone 205-978-5000 or at Web sites <http://www.asrm.org> and <http://www.sart.org>).

19. Where can I get additional information on US fertility clinics?

For further information on specific clinics, contact the clinic directly (see Appendix C for current contact information). In addition, SART can provide general information on its member clinics (telephone 205-978-5000, extension 109).

20. What's new in the 2012 report?

CDC is constantly striving to present the most accurate and relevant ART clinic success rates to help potential ART users make decisions. Changes to the clinic table and National Summary table format have been made to provide a more comprehensive and user-friendly presentation of clinic and national success rates data. Highlights of modifications designed to enhance clarity, readability, and improve the presentation of data include the following:

2012 ART Success Rates Section

- Addition of total number of ART cycles performed, which includes the total number of egg/embryo banking cycles for each clinic (indicated in parentheses).
- Addition of footnote providing the total number of cycles in which a new treatment procedure was being evaluated for each clinic.
- Addition of the new measure, estimated average number of transfers per retrieval, for frozen nondonor cycles.

2012

Fertility Clinic Tables

INTRODUCTION TO FERTILITY CLINIC TABLES

The first table in this section is the 2012 National Summary of combined data from all clinics. Individual clinic tables follow, with each clinic's data presented in a one-page table that includes the types of assisted reproductive technology (ART) used, patient diagnoses, success rates, and individual clinic characteristics. Clinics reporting their data to the Centers for Disease Control and Prevention (CDC) are listed in alphabetical order by state, city, and clinic name. Each known nonreporting clinic is also included in alphabetical order, although no data are presented for these clinics.

Many people considering ART will want to use this report to find the “best” clinic. However, comparisons between clinics must be made with caution. Many factors contribute to the success of an ART procedure. Some factors are related to the training and experience of the ART clinic and laboratory professionals and the quality of services they provide. Other factors are related to the patients themselves, such as their age, quality of their eggs and sperm, cause of their infertility, genetic factors, and diagnosis. Some clinics may be more willing than others to accept patients with low chances of success or may specialize in ART treatments that attract particular types of patients.

We encourage consumers considering ART to contact clinics to discuss their specific medical situations and their potential for success using ART. Because clinics did not have the opportunity to provide narratives to explain their data in this report, such conversations could provide additional information to help consumers decide whether to use ART.

Although ART offers important options for the treatment of infertility, the decision to use ART involves many factors in addition to success rates. Therefore, consumers should carefully examine all related financial, psychological, and medical issues before beginning treatment. They also will want to consider the location of the clinic, the counseling and support services available, and the rapport that staff members have with their patients.

Important Factors to Consider When Using These Tables to Assess a Clinic

- ***ART statistics are from 2012***

Data for cycles started in 2012 could not be published until 2014 because the final outcomes of pregnancies conceived in December 2012 were not known until October 2013. Additional time was then required to collect and analyze the data and prepare the report. Many factors that contribute to a clinic's success rate may have changed in the 2 years since these cycles were performed. Personnel may be different. Equipment and training may or may not have been updated. As a result, success rates for 2012 may not necessarily represent current rates.

- **Success rates may vary**

A clinic's success rates may vary from year to year even if all determining factors remain the same. The more cycles that a clinic carries out, the less the rate is likely to vary. Conversely, clinics that perform fewer cycles are likely to have more variability in success rates from year to year. As an extreme example, if a clinic reports only one ART cycle in a given category, as is sometimes the case in the data presented here, the clinic's success rate in that category would be either 0% or 100%. Because success rates may be misleading if they are based on a small number, the rates are shown as fractions rather than percentages when fewer than 20 cycles or outcomes (pregnancies, transfers, births) are reported in a given category.

- **Some clinics see more than the average number of patients with difficult infertility problems**

Some clinics are willing to offer ART to most potential patients, even those who have a low probability of success. Others discourage such patients or encourage them to use donor eggs, a practice that results in higher success rates among older women. Clinics that accept a higher percentage of women who previously have had multiple unsuccessful ART cycles will generally have lower success rates. In contrast, clinics that offer ART procedures to women who might have become pregnant with less technologically advanced treatment will generally have higher success rates.

- **The percentage of cycles that are canceled varies**

Percentages of canceled cycles using fresh nondonor eggs or embryos vary among clinics from less than 1% to, in a few cases, more than 25%. A high percentage of cancellations tends to lower the percentage of cycles resulting in live births but may increase the percentage of embryo transfers resulting in live births.

- **Percentages of unstimulated (or "natural") cycles are included with those for stimulated cycles**

In an unstimulated cycle, the woman ovulates naturally rather than as the result of the daily injections used in stimulated cycles. Unstimulated cycles are less expensive because they require no daily injections and fewer ultrasounds and blood tests. However, women who use natural or mild stimulation produce only one or two follicles, thus reducing the potential number of embryos for transfer. As a result, clinics that perform a relatively high percentage of unstimulated cycles may have lower success rates. Nationally, 1% of ART cycles using fresh nondonor eggs or embryos in 2012 were unstimulated.

- **Success rates are calculated per cycle rather than per patient**

Success rates shown in this report are presented in terms of cycles, as required by law, rather than in terms of patients. As a result, patients who had more than one ART cycle in 2012 are represented in multiple cycles that are not linked. In addition, for patients who undergo both fresh and frozen cycles, success rates are calculated separately for each cycle. Clinics that have a very high percentage of cycles resulting in live births with frozen embryos would have higher ART success rates if these births were included as successes from the original stimulated cycle. Consumers should look at both rates (for cycles using fresh embryos and for those using frozen embryos) when assessing a clinic's success rates.

- ***The number of embryos transferred varies from clinic to clinic***

In 2012, the average number of embryos that nearly all clinics transferred to women younger than age 35 ranged from 1 to 3 for fresh nondonor cycles. The American Society for Reproductive Medicine (ASRM) and the Society for Assisted Reproductive Technology (SART) discourage the transfer of a large number of embryos because of the increased likelihood of multiple-fetus pregnancies. Multiple-fetus pregnancies, in turn, increase the probability of premature births and related health problems.

An explanation of how to read a fertility clinic table begins on page 15.

How to Read a Fertility Clinic Table

This section is provided to help consumers understand the information presented in the fertility clinic tables. The number before each heading refers to the number of the corresponding section in the sample clinic table on page 14. Technical terms are defined in the Glossary of Terms (see Appendix B on pages 517–519).

1. Verification

To have success rates published in the annual report, a clinic's medical director must verify the accuracy of the data reported to CDC. The name of the medical director who verified the clinic's data is shown.

2. Type of ART and procedural factors

This section gives the percentage of in vitro fertilization (IVF) cycles using fresh nondonor embryos. It also lists the percentage of ART cycles using fresh nondonor eggs or embryos that were unstimulated, that used a gestational carrier, that involved intracytoplasmic sperm injection (ICSI), and that used preimplantation genetic diagnosis (PGD).

3. Patient diagnosis

This section gives the percentage of ART cycles for which patients had a particular diagnosis out of the total number of cycles performed at the clinic. Cycles started with the intent of freezing and banking all eggs/embryos for future use are not included in the calculations of percentages in this section.

Consumers may want to know what percentage of cycles are performed for a clinic's patients with the same diagnosis as they have. In addition, patients' diagnoses may affect a clinic's success rates. However, the use of these diagnostic categories may vary somewhat from clinic to clinic, and total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

4. Total number of cycles performed, including banking cycles

The first number represents total ART cycles started at the clinic in 2012. It includes the total number of cycles with the intention of freezing and banking (cryopreserving) all resulting eggs/embryos for potential future use, which is shown in parentheses. The total number of ART cycles performed excludes any cycles in which a new procedure was being evaluated (a small number nationwide). The number of cycles in which a new procedure was being evaluated is shown in footnote e, and this cycle type is not used to calculate clinic success rates presented in clinic tables or the national summary.

5. Success rates by type of cycle

Success rates are given for the three categories of ART cycles included in Sections 7–9: cycles using fresh embryos from nondonor eggs, cycles using frozen embryos from nondonor eggs, and cycles using donor eggs. The success rates shown are calculated on the basis of data from all ART cycle procedures (IVF, gamete intrafallopian transfer or GIFT, and zygote intrafallopian transfer or ZIFT).

Success rates for the birth of a single live infant (a singleton live birth) are emphasized in the table because they are an important measure of success. Multiple-infant births are associated with increased risk of adverse outcomes for mothers and infants, including higher rates of caesarean section, prematurity, low birth weight, and infant disability or death.

Clinic table success rates indicate the average chance of success for cycles started at the clinic in 2012. Success rates are calculated by ART cycle stage (start, transfer, pregnancy) and by age group or for all ages combined. For example, if a clinic started 50 cycles in 2012, and these resulted in 15 live births, the average success rate for cycles started at that clinic would be

$$15 \text{ (births)} \div 50 \text{ (cycles)} = 0.3 \text{ or } 30\%$$

Thus, the success rate at that clinic in 2012 was 30%, meaning that 30% of cycles started that year resulted in a live birth.

Success rate calculations may be misleading if they are based on a small number. Therefore, when fewer than 20 cycles or outcomes (pregnancies, transfers) are reported in a given category, the rates are shown as fractions rather than percentages. For example, suppose that the sample clinic performed only 19 fresh embryo cycles using nondonor eggs among women aged 41–42 years. Of these 19 cycles, 2—or about 10%—resulted in a live birth. Because of the small number of cycles, 10% is not a statistically reliable success rate, so the success rate is presented as 2/19, meaning 2 out of 19 cycles started resulted in a live birth.

6. Age of woman

Because a woman's fertility declines with age, clinics report lower success rates for older women attempting to become pregnant with their own eggs. For this reason, rates for women using nondonor eggs or embryos are reported separately for women younger than age 35, for women aged 35–37, aged 38–40, aged 41–42, aged 43–44, and for woman older than age 44. The sample clinic table illustrates the decline in ART success rates among older women. For example, for cycles that used fresh embryos from nondonor eggs, the percentage of cycles resulting in live births among women younger than age 35 was 37.4%, whereas the percentage of cycles resulting in live births among women aged 38–40 was 20.6%.

7. Cycles using fresh embryos from nondonor eggs

This section includes success rates for all ART cycles started with the intent to use fresh embryos from a woman's own eggs. Cycles started with the intention of freezing and banking all eggs/embryos for future use are not included in the calculations of success rates in this section.

- **Number of cycles**

This represents the number of ART cycles by age of woman.

- **Percentage of cancellations**

This is calculated as follows: number of cycles canceled divided by the total number of cycles, expressed as a percentage of cycles.

This refers to cycles that were stopped before an egg retrieval was attempted. A cycle may be canceled if a woman's ovaries do not respond to fertility medications and thus do not produce a sufficient number of follicles. Cycles also may be canceled because of illness or other medical or personal reasons.

- **Average number of embryos transferred**

This is calculated as follows: number of embryos transferred divided by number of cycles in which one or more embryos were transferred.

The average number of embryos transferred varies from clinic to clinic. ASRM and SART have practice guidelines that address this issue. Further information can be obtained from ASRM or SART (both at telephone 205-978-5000 or at Web sites <http://www.asrm.org> and <http://www.sart.org>).

- **Percentage of embryos transferred resulting in implantation**

This is calculated as follows: the larger of either the maximum number of fetal hearts or maximum number of infants born [live births + stillbirths] divided by the number of embryos transferred, expressed as a percentage of embryos transferred.

This represents the cycles resulting in an intrauterine clinical pregnancy out of the total number of embryos transferred in which one or more embryos were transferred. Not all fetal hearts can be detected by ultrasound. For this reason, a positive intrauterine clinical pregnancy is defined as the larger of either the maximum number of fetal hearts detected by ultrasound or maximum number of infants born, including live births and stillbirths.

- **Percentage of elective single embryo transfer (eSET)**

This is calculated as follows: the number of cycles in which one embryo was transferred and one or more embryos were cryopreserved, divided by the number of transfer procedures in which either one embryo was transferred and one or more embryos were cryopreserved or more than one embryo was transferred, expressed as a percentage of these transfer procedures.

This represents the cycles in which one embryo is selected to be transferred from a larger number of available embryos, usually for the purpose of reducing the chance of having a multiple birth. For these cycles, one or more of the extra embryos are cryopreserved during the current cycle for future use.

7A. Outcomes per cycle

In this section, success rates using fresh embryos from nondonor eggs are calculated as a percentage of the fresh nondonor ART cycles started. The number of cycles that a clinic starts is not the same as the number of patients treated because some patients start more than one cycle in a year.

- **Percentage of cycles resulting in singleton live births**

This is calculated as follows: number of singleton live births divided by number of cycles, expressed as a percentage of cycles.

This represents the cycles that resulted in the birth of a single live infant out of all cycles started.

- **Percentage of cycles resulting in triplets or more live births**

This is calculated as follows: number of triplet or more live births divided by number of cycles, expressed as a percentage of cycles.

This represents the cycles that resulted in a triplet or more live birth out of all cycles started. A multiple-infant birth with one or more infants born live is counted as one live birth.

- **Percentage of cycles resulting in live births**

This is calculated as follows: number of live births divided by number of cycles, expressed as a percentage of cycles.

This represents the cycles that resulted in a live birth out of all cycles started. A cycle resulting in live birth may include one or more infants born alive; that is, a multiple-infant birth (e.g., twins, triplets) with at least one live-born infant is counted as one live birth.

- **Percentage of cycles resulting in pregnancy**

This is calculated as follows: number of pregnancies divided by number of cycles, expressed as a percentage of cycles.

This represents the cycles that resulted in a pregnancy out of all cycles started. Because some pregnancies end in a miscarriage, induced abortion, or stillbirth, the percentage of cycles resulting in pregnancies is usually higher than the percentage of cycles resulting in live births.

7B. Outcomes per transfer

In this section, success rates using fresh embryos from nondonor eggs are calculated as a percentage of fresh nondonor ART cycles in which an embryo transfer procedure was attempted, even if no embryos were successfully transferred. A clinic may begin cycles that do not proceed to transfer because not every cycle started results in successful egg retrieval, fertilization, and embryo transfer. For this reason, percentages of transfers resulting in pregnancies and live births generally are higher than the percentage for cycles started.

- **Number of transfers**

This represents the number of transfers by age of woman.

- **Percentage of transfers resulting in singleton live births**

This is calculated as follows: number of singleton live births divided by number of transfers, expressed as a percentage of transfers.

This represents the transfer procedures that resulted in the birth of a single live infant out of all cycles in which a transfer was attempted.

- **Percentage of transfers resulting in triplets or more live births**

This is calculated as follows: number of triplet or more live births divided by number of transfers, expressed as a percentage of transfers.

This represents the transfer procedures that resulted in a triplet or more live birth out of all cycles in which a transfer was attempted. A multiple-infant birth with one or more infants born live is counted as one live birth.

- **Percentage of transfers resulting in live births**

This is calculated as follows: number of live births divided by number of transfers, expressed as a percentage of transfers.

This represents the transfer procedures that resulted in a live birth out of all cycles in which a transfer was attempted. A transfer resulting in live birth may include one or more infants born alive; that is, a multiple-infant birth (e.g., twins, triplets) with at least one live-born infant is counted as one live birth.

- **Percentage of transfers resulting in pregnancy**

This is calculated as follows: number of pregnancies divided by number of transfers, expressed as a percentage of transfers.

This represents the transfer procedures that resulted in a pregnancy out of all cycles in which a transfer was attempted. Because some pregnancies end in a miscarriage, induced abortion, or stillbirth, the percentage of transfers resulting in pregnancies is usually higher than the percentage of transfers resulting in live births.

7C. Outcomes per pregnancy

In this section, success rates using fresh embryos from nondonor eggs are calculated as a percentage of fresh nondonor ART cycles resulting in pregnancy. A pregnancy with more than one fetus is counted as one pregnancy. Because not every cycle started results in successful egg retrieval, fertilization, transfer, and pregnancy, the percentage of pregnancies resulting in live births generally is higher than percentages for cycles started or transfers attempted.

- **Number of pregnancies**

This represents the number of pregnancies by age of woman.

- **Percentage of pregnancies resulting in singleton live births**

This is calculated as follows: number of singleton live births divided by number of pregnancies, expressed as a percentage of pregnancies.

This represents the pregnancies that resulted in the birth of a single live infant out of all cycles resulting in a pregnancy. It includes multiple-fetus pregnancies that may have been reduced to a single-fetus pregnancy by the time of birth, either naturally (e.g., fetal death) or because a woman and her doctor decided to reduce the number of fetuses through a procedure called multifetal pregnancy reduction. (CDC does not collect information on multifetal pregnancy reductions.)

- **Percentage of pregnancies resulting in triplets or more live births**

This is calculated as follows: number of triplet or more live births divided by number of pregnancies, expressed as a percentage of pregnancies.

This represents the pregnancies that resulted in a triplet or more live birth out of all cycles resulting in a pregnancy. A multiple-infant birth with one or more infants born live is counted as one live birth.

- **Percentage of pregnancies resulting in live births**

This is calculated as follows: number of live births divided by number of pregnancies, expressed as a percentage of pregnancies.

This represents the pregnancies that resulted in a live birth out of all cycles resulting in a pregnancy. A pregnancy resulting in live birth may include one or more infants born alive; that is, a multiple-infant birth (e.g., twins, triplets) with at least one live-born infant is counted as one live birth.

8. Cycles using frozen embryos from nondonor eggs

Frozen embryo cycles are those in which previously frozen (cryopreserved) embryos are thawed and transferred. Because these cycles use embryos formed from a previous cycle, no stimulation or retrieval is involved in the current cycle. As a result, these cycles usually are less expensive and less invasive than cycles using fresh embryos. In addition, freezing some of the embryos from a retrieval procedure may increase a woman's overall chances of having a child from a single retrieval.

Success rates for cycles using frozen embryos from nondonor eggs are calculated as the percentage of these cycles resulting in embryo transfer, not the percentage of cycles started; not every cycle started results in successful thaw of frozen embryos or proceeds to transfer. The embryos transferred in frozen nondonor cycles come from prior cycles with the original intent to retrieve and transfer embryos (fresh nondonor cycles) and in which one or more embryos were frozen (cryopreserved). Embryos transferred in frozen nondonor cycles also come from "banking cycles" with the original intent to cryopreserve all retrieved eggs/embryos for future use. Banking cycles may be performed to avoid potentially negative effects of stimulation, or when it is necessary to wait for results of genetic testing. Since some patients may only develop a small number of eggs during a single cycle, women may undergo several short-term banking cycles to improve availability of good-quality eggs/embryos for later transfer. In other situations, patients may choose to freeze eggs or embryos because the patient or partner needs to undergo medical treatment that may harm their future reproduction capabilities or to delay childbearing for other reasons.

The average number of frozen nondonor transfers per fresh nondonor retrieval is the only calculation in the clinic table that includes banking cycles. See Sections 8A for the interpretation of this success rate and Sections 7 and 7B on pages 16–19 for the interpretation of other success rates.

8A. Estimated average number of transfers per retrieval

This is calculated as follows: number of frozen nondonor cycles in which embryos were transferred divided by the sum of the number of banking cycles among all patients and the number of fresh nondonor cycles among those patients with at least one frozen nondonor cycle resulting in embryo transfer.

This measure provides an estimate of the average number of transfers from frozen nondonor cycles for a patient per retrieval. All banking cycles started during the reporting year, and any fresh nondonor cycles performed during the reporting year among patients who received a transfer of frozen nondonor embryos are included. Frozen nondonor transfers performed early in the reporting year might have involved eggs/embryos retrieved and frozen during cycles performed in previous years. Additionally, cycles in which retrieval and cryopreservation occurred late in the reporting year may not contribute to frozen nondonor cycles in which thawed embryos are transferred until subsequent years.

This measure will be lower in clinics performing a larger number of short-term banking cycles to increase the number of good-quality embryos available for transfer, or in clinics performing a larger number of long-term banking cycles for fertility preservation. On the other hand, this measure will be higher in clinics practicing elective single embryo transfer (eSET) when one retrieval cycle results in several subsequent frozen nondonor cycles.

9. Cycles using donor eggs

Women who are older, have premature ovarian failure (early menopause), whose ovaries have been removed, and who have a genetic concern about using their own eggs may consider using eggs that are donated by a young, healthy woman. Embryos donated by patients who previously had ART also may be available. Many clinics provide services for donor egg and embryo cycles.

In this section, success rates are presented separately for ART cycles using fresh donor eggs or embryos and those using frozen donor embryos. For these cycle types, results among women in all age groups are reported together because previous data show that patient age does not affect success rates with donor eggs. Success rates using donor eggs or embryos are calculated as a percentage of transfers, and cycles started with the intention of freezing and banking all eggs/embryos for future use are not included in any calculations of success rates in this section. See Sections 7 and 7B on pages 16–19 for the interpretation of success rates.

10. Current clinic services and profile

- **Current name**

This may reflect a clinic name change that occurred since 2012, whereas the clinic name at the top of the table was the name of the ART clinic as it existed in 2012. Some clinics not only have changed their names but have reorganized as well. Reorganization is defined as a change in ownership or affiliation or a change in at least two of the three key staff positions (practice director, medical director, or laboratory director). In such cases, no current name is listed, but a statement that the clinic has undergone reorganization since 2012 is included, and no current clinic services or profile are listed.

- **Donor egg**

Some clinics have programs for ART using donor eggs. Donor eggs are eggs that have been retrieved from one woman (the donor) and then transferred to another woman (the recipient). Policies regarding sharing of donor eggs vary from clinic to clinic.

- **Donor embryo**

This refers to whether the clinic has a program for ART using embryos that were donated by other patients who previously underwent ART treatment and had extra embryos available.

- **Single women**

Clinics have varying policies regarding ART services for single (unmarried) women.

- **Gestational carriers**

A gestational carrier is a woman who carries a child for others; sometimes such women are referred to as gestational surrogates. Policies regarding ART services using gestational carriers vary from clinic to clinic. Some states do not permit clinics to offer this service.

- **Embryo cryopreservation**

This item refers to whether the clinic has a program for freezing extra embryos that may be available from a patient's ART cycle.

- **SART member**

In 2012, 377 of the 456 reporting clinics were SART members.

- **Verified lab accreditation**

If "Yes" appears next to this item, the ART clinic uses an embryo laboratory accredited by one or more of three specific accrediting organizations. If "Pending" appears here, it means that the clinic has submitted an application for accreditation to one or more of the three organizations and has provided proof of such application to CDC. "No" indicates that the embryo laboratory has not been accredited by any of these three organizations or has not provided proof of accreditation to CDC.

CDC provides this information as a public service. Please note that CDC does not oversee any of these accreditation programs. They are all nonfederal programs. To become certified, laboratories must have in place systems and processes that comply with the accrediting organization's standards. Depending on the organization, standards may include those for personnel, quality control and quality assurance, specimen tracking, results reporting, and the performance of technical procedures. Compliance with these standards is confirmed by documentation provided by the laboratory and by on-site inspections. For further information, consumers may contact the three accrediting organizations directly:

- College of American Pathologists (CAP): For a list of accredited laboratories, call 800-323-4040 and follow the prompts for Laboratory Accreditation.
- The Joint Commission: Call 630-792-5800 to inquire about the status of individual laboratories.
- New York State Tissue Bank Program (NYSTB): Call 518-485-5341 to find out which laboratories are certified under the tissue bank regulations.

Further information on laboratory accreditation for specific clinics is provided in Appendix C.

2012 NATIONAL SUMMARY

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

2012 ART CYCLE PROFILE

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: ART Fertility Program of Alabama					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**UNIVERSITY OF ALABAMA AT BIRMINGHAM
BIRMINGHAM, ALABAMA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Peninsula Medical Center, John Nels Anderson, MD					
Donor egg?	No	Gestational carriers?	No	SART member?	No
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	No
Single women?	No			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

TROCHÉ FERTILITY CENTERS GLENDALE, ARIZONA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

THE FERTILITY INSTITUTES-LOS ANGELES, NEW YORK, GUADALAJARA ENCINO, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Percentage of embryos transferred resulting in implantation		66.7		51.7		
Percentage of transfers resulting in singleton live births		4 / 12		7 / 15		
Percentage of transfers resulting in live births		9 / 12		9 / 15		
Percentage of transfers resulting in pregnancy		10 / 12		13 / 15		

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Fertility Center of Southern California

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**HOPE IVF AND FERTILITY CENTER
IRVINE, CALIFORNIA**

This clinic provided ART services during 2012 and is therefore required to submit ART cycle data under the provisions of the Fertility Clinic Success Rate and Certification Act.

This clinic either did not submit 2012 ART cycle data or the clinic's Medical Director did not approve the clinic's 2012 ART cycle data for inclusion in this report.

LIFE IVF CENTER IRVINE, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

2012 ART CYCLE PROFILE

Data verified by Frank D. Yelian, MD, PhD

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Reproductive Sciences Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

ACACIO FERTILITY CENTER LAGUNA NIGUEL, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: CHA Fertility Center					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

PACIFIC FERTILITY CENTER-LOS ANGELES LOS ANGELES, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: The Fertility and Gynecology Center, Monterey Bay IVF Program					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes				(See Appendix C for details.)

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

NOVA IN VITRO FERTILIZATION MOUNTAIN VIEW, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Number of cycles	35		60			
Number of transfers	32		56			
Average number of embryos transferred	1.7		1.5			
Percentage of embryos transferred resulting in implantation	58.5		31.4			
Percentage of transfers resulting in singleton live births	34.4		30.4			
Percentage of transfers resulting in live births	56.3		39.3			
Percentage of transfers resulting in pregnancy	65.6		41.1			

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Stanford Fertility and Reproductive Medicine Center, Stanford University Department of Gynecology and Obstetrics

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

HRC FERTILITY-PASADENA PASADENA, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

NTC INFERTILITY CLINIC SAN DIEGO, CALIFORNIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Pacific Fertility Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**UCSF CENTER FOR REPRODUCTIVE HEALTH
SAN FRANCISCO, CALIFORNIA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Santa Monica UCLA GYN Subspecialties Group					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**SANTA MONICA FERTILITY
SANTA MONICA, CALIFORNIA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

YALE FERTILITY CENTER NEW HAVEN, CONNECTICUT

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

2012 ART CYCLE PROFILE

Data verified by Pasquale Patrizio, MD

Type of ART and Procedural Factors ^a				Patient Diagnosis ^b				
IVF	100%	With ICSI	79%	Tubal factor	10%	Uterine factor	4%

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

JAMES A. SIMON, MD, PC
WASHINGTON, DISTRICT OF COLUMBIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Viera Fertility Center, Fertility and Reproductive Medicine Center for Women					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

FERTILITY & IVF CENTER OF MIAMI, INC. MIAMI, FLORIDA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: New Leaders in Infertility & Endocrinology, LLC					
Donor egg?	No	Gestational carriers?	No	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

FERTILITY & GENETICS PLANTATION, FLORIDA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

UNIVERSITY OF SOUTH FLORIDA IVF TAMPA, FLORIDA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Reproductive Resource Center of Greater Kansas City

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

This clinic provided ART services during 2012 and is therefore required to submit ART cycle data under the provisions of the Fertility Clinic Success Rate and Certification Act.

This clinic either did not submit 2012 ART cycle data or the clinic's Medical Director did not approve the clinic's 2012 ART cycle data for inclusion in this report.

THE CENTER FOR REPRODUCTIVE MEDICINE WICHITA, KANSAS

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Montgomery Fertility Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	No
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	No
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

FERTILITY CENTER OF MARYLAND TOWSON, MARYLAND

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: Boston IVF					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

CENTER FOR REPRODUCTIVE MEDICINE
UNIVERSITY OF MICHIGAN REPRODUCTIVE ENDOCRINOLOGY AND INFERTILITY
ANN ARBOR, MICHIGAN

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

2012 ART CYCLE PROFILE

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Michigan Comprehensive Fertility Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**GRAND RAPIDS FERTILITY & IVF, PC
GRAND RAPIDS, MICHIGAN**

This clinic provided ART services during 2012 and is therefore required to submit ART cycle data under the provisions of the Fertility Clinic Success Rate and Certification Act.

This clinic either did not submit 2012 ART cycle data or the clinic's Medical Director did not approve the clinic's 2012 ART cycle data for inclusion in this report.

MICHIGAN REPRODUCTIVE & IVF CENTER, PC GRAND RAPIDS, MICHIGAN

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Donor egg?	Yes	Gestational carriers?	No
Donor embryo?	No	Embryo cryopreservation?	Yes
Single women?	Yes	SART member?	Yes
		Verified lab accreditation?	Pending
		(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

REPRODUCTIVE MEDICINE ASSOCIATES OF MICHIGAN TROY, MICHIGAN

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Reproductive Medicine Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

MAYO CLINIC ASSISTED REPRODUCTIVE TECHNOLOGIES ROCHESTER, MINNESOTA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Fertility Partnership

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	No
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	No
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 1 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**CENTER FOR REPRODUCTIVE MEDICINE & ROBOTIC SURGERY
ST. LOUIS, MISSOURI**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Nebraska Methodist Hospital REI					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

FERTILITY CENTER OF LAS VEGAS LAS VEGAS, NEVADA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Cooper Institute for Reproductive Hormonal Disorders					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

DELAWARE VALLEY INSTITUTE OF FERTILITY AND GENETICS MARLTON, NEW JERSEY

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Center for Reproductive Medicine of New Mexico					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

THE FERTILITY INSTITUTE AT NEW YORK METHODIST HOSPITAL BROOKLYN, NEW YORK

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: The New York Fertility Center					
Donor egg?	Yes	Gestational carriers?	No	SART member?	No
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

MONTEFIORE'S INSTITUTE FOR REPRODUCTIVE MEDICINE AND HEALTH HARTSDALE, NEW YORK

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

WESTCHESTER REPRODUCTIVE MEDICINE MT. KISCO, NEW YORK

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: NYU Fertility Center, New York University School of Medicine

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

OFFICES FOR FERTILITY AND REPRODUCTIVE MEDICINE NEW YORK, NEW YORK

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: East Coast Fertility					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

ROCHESTER FERTILITY CARE, PC ROCHESTER, NEW YORK

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: CNY Fertility Center

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: University of North Carolina A.R.T. Clinic

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**CMC REPRODUCTIVE MEDICINE AND INFERTILITY
CMC WOMEN'S INSTITUTE
CHARLOTTE, NORTH CAROLINA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

REPRODUCTIVE GYNECOLOGY, INC. WESTERVILLE, OHIO

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

REPRODUCTIVE HEALTH SPECIALISTS, INC. PITTSBURGH, PENNSYLVANIA

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

PENNSYLVANIA

**THE FERTILITY CENTER, LLC
YORK, PENNSYLVANIA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Number of transfers	7		5			
Average number of embryos transferred	1.7		1.6			
Percentage of embryos transferred resulting in implantation	5 / 12		1 / 8			
Percentage of transfers resulting in singleton live births	3 / 7		1 / 5			
Percentage of transfers resulting in live births	4 / 7		1 / 5			
Percentage of transfers resulting in pregnancy	4 / 7		1 / 5			

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Tennessee Reproductive Medicine

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

QUILLEN FERTILITY AND WOMEN'S SERVICES JOHNSON CITY, TENNESSEE

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Dr. Jeffrey Youngkin, Austin Fertility Center

Donor egg?	No	Gestational carriers?	No	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	No			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

CENTER FOR ASSISTED REPRODUCTION BEDFORD, TEXAS

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: IVF Institute, PA					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	No
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

REPRODUCED FERTILITY CENTER DALLAS, TEXAS

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE					
Current Name: Frisco Institute for Reproductive Medicine					
Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	Yes	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	No			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

ADVANCED FERTILITY CENTER OF TEXAS HOUSTON, TEXAS

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

HOUSTON FERTILITY INSTITUTE HOUSTON, TEXAS

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: This clinic has closed or reorganized since 2012. Information on current clinic services and profile therefore is not provided here. Contact the NASS Help Desk for current information about this clinic.

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.
^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.
^c A multiple-infant birth is counted as one live birth if at least one infant is live born.
^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.
^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.
^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

**UNIVERSITY CENTER FOR ADVANCED REPRODUCTIVE MEDICINE
RICHMOND, VIRGINIA**

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: University Reproductive Care, University of Washington					
Donor egg?	No	Gestational carriers?	No	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes	(See Appendix C for details.)			

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

THE CENTER FOR REPRODUCTIVE HEALTH SPOKANE, WASHINGTON

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

CURRENT CLINIC SERVICES AND PROFILE

Current Name: Reproductive Specialty Center, IVF Columbia

Donor egg?	Yes	Gestational carriers?	Yes	SART member?	Yes
Donor embryo?	No	Embryo cryopreservation?	Yes	Verified lab accreditation?	Yes
Single women?	Yes			(See Appendix C for details.)	

^a Reflects features of fresh nondonor cycles. If IVF is <100%, the remaining cycles are GIFT, ZIFT, or a combination of these procedures with IVF.

^b Total patient diagnosis percentages may be greater than 100% because more than one diagnosis can be reported for each cycle.

^c A multiple-infant birth is counted as one live birth if at least one infant is live born.

^d When denominator is <20, rates are shown as fractions. Calculating percentages from these fractions may be misleading.

^e Number of cycles excludes 0 cycle(s) in which new procedures were evaluated.

^f All ages are reported together because previous data show that patient age does not materially affect success with donor eggs.

GUNDERSEN FERTILITY LUTHERAN FERTILITY CENTER ONALASKA, WISCONSIN

A comparison of clinic success rates may not be meaningful because patient medical characteristics and treatment approaches vary from clinic to clinic. For more details about how to interpret the statistics in this table, see pages 11–22.

Appendix A

Technical Notes

APPENDIX A: TECHNICAL NOTES

Validation of 2012 ART Data

Site visits to assisted reproductive technology (ART) clinics for validation of 2012 ART data were conducted during April through June 2014. For validation of 2012 data, 35 of the 456 reporting clinics were randomly selected after taking into consideration the number of ART procedures performed at each clinic, some cycle and clinic characteristics, and whether the clinic had been selected before. During each validation visit, ART data reported by the clinic to the Centers for Disease Control and Prevention were compared with information documented in medical records.

For each clinic, the fully validated sample included up to 40 ART cycles resulting in pregnancy and up to 20 ART cycles not resulting in pregnancy. Up to 10 cycles using donor eggs were included among the fully validated sample at each clinic. In total, 2,045 ART cycles performed in 2012 across the 35 clinics were randomly selected for full validation, along with 238 egg/embryo banking cycles. The full validation included review of 1,318 cycles for which a pregnancy was reported. Among the nondonor cycles, 331 were multiple-fetus pregnancies. In addition, among patients whose cycles were validated, we verified the number of ART cycles performed during 2012. For each of these patients, we compared the total number of ART cycles reported with the total number of ART cycles included in the medical record. If unreported cycles were identified in selected medical records, up to 10 of these cycles were also selected for partial validation.

Findings and discrepancy rates from the 2012 validation visits will be available later this year.

2012

Appendix B

Glossary of Terms

APPENDIX B: GLOSSARY OF TERMS

Adverse outcome. A pregnancy that does not result in a live birth. The adverse outcomes reported for ART procedures are miscarriages, induced abortions, and stillbirths.

American Society for Reproductive Medicine (ASRM). Professional society whose affiliate organization, the Society for Assisted Reproductive Technology (SART), is composed of clinics and programs that provide ART.

ART (assisted reproductive technology). All treatments or procedures that involve surgically removing eggs from a woman's ovaries and combining the eggs with sperm to help a woman become pregnant. The types of ART are in vitro fertilization (IVF), gamete intrafallopian transfer (GIFT), and zygote intrafallopian transfer (ZIFT).

ART cycle. A process in which (1) an ART procedure is performed, (2) a woman has undergone ovarian stimulation or monitoring with the intent of having an ART procedure, or (3) frozen embryos have been thawed with the intent of transferring them to a woman. A cycle begins when a woman begins taking fertility drugs or having her ovaries monitored for follicle production.

Canceled cycle. An ART cycle in which ovarian stimulation was performed but was stopped before eggs were retrieved or, in the case of frozen embryo cycles, before embryos were transferred. Cycles are canceled for many reasons: eggs may not develop, the patient may become ill, or the patient may choose to stop treatment.

Combination cycle. A cycle that uses more than one ART procedure. Combination cycles usually involve IVF plus either GIFT or ZIFT.

Cryopreservation. The practice of freezing extra embryos from a patient's ART cycle for potential future use.

Diminished ovarian reserve. This diagnosis means that the ability of the ovary to produce eggs is reduced. Reasons include congenital, medical, or surgical causes or advanced age.

Donor egg cycle. An embryo is formed from the egg of one woman (the donor) and then transferred to another woman (the recipient). The donor relinquishes all parental rights to any resulting offspring.

Donor embryo. An embryo that is donated by a patient who previously underwent ART treatment and had extra embryos available.

Ectopic pregnancy. A pregnancy in which the fertilized egg implants in a location outside of the uterus—usually in the fallopian tube, the ovary, or the abdominal cavity. Ectopic pregnancy is a dangerous condition that must receive prompt medical treatment.

Egg. A female reproductive cell, also called an oocyte or ovum.

Egg retrieval (also called oocyte retrieval). A procedure to collect the eggs contained in the ovarian follicles.

Egg transfer (also called oocyte transfer). The transfer of retrieved eggs into a woman's fallopian tubes through laparoscopy. This procedure is used only in GIFT.

Embryo. An egg that has been fertilized by a sperm and has undergone one or more divisions.

Embryo transfer. Placement of embryos into a woman's uterus through the cervix after IVF: in ZIFT, the embryos are placed in a woman's fallopian tube.

Endometriosis. A medical condition that involves the presence of tissue similar to the uterine lining in abnormal locations. This condition can affect both fertilization of the egg and embryo implantation.

eSET (elective single embryo transfer). Elective single embryo transfer is a procedure in which one embryo, selected from a larger number of available embryos, is placed in the uterus or fallopian tube. The embryo selected for eSET might be from a previous IVF cycle (i.e., cryopreserved embryos [frozen]) or from the current fresh IVF cycle that yielded more than one embryo. The remaining embryos may be set aside for future use or cryopreservation.

Fertility Clinic Success Rate and Certification Act of 1992 (FCSRCA). Law passed by the United States Congress in 1992 requiring all clinics performing ART in the United States to annually report their success rate data to the Centers for Disease Control and Prevention.

Fertilization. The penetration of the egg by the sperm and the resulting combining of genetic material that develops into an embryo.

Fetus. The unborn offspring from the eighth week after conception to the moment of birth.

Follicle. A structure in the ovaries that contains a developing egg.

Fresh eggs, sperm, or embryos. Eggs, sperm, or embryos that have not been frozen. Fresh embryos, however, may have been conceived using either fresh or frozen sperm.

Frozen embryo cycle. An ART cycle in which frozen (cryopreserved) embryos are thawed and transferred to the woman.

Gamete. A reproductive cell, either a sperm or an egg.

Gestation. The period of time from conception to birth.

Gestational carrier (also called a gestational surrogate). A woman who gestates, or carries, an embryo that was formed from the egg of another woman. The gestational carrier usually has a contractual obligation to return the infant to its intended parents.

Gestational sac. A fluid-filled structure that develops within the uterus early in pregnancy. In a normal pregnancy, a gestational sac contains a developing fetus.

GIFT (gamete intrafallopian transfer). An ART procedure that involves removing eggs from the woman's ovary, combining them with sperm, and using a laparoscope to place the unfertilized eggs and sperm into the woman's fallopian tube through small incisions in her abdomen.

ICSI (intracytoplasmic sperm injection). A procedure in which a single sperm is injected directly into an egg; this procedure is commonly used to overcome male infertility problems.

Implantation rate. A measurement of ART success when the ART cycle results in an intrauterine clinical pregnancy, defined as the larger of either the number of maximum fetal hearts by ultrasound or maximum infants born, including live births and stillbirths, out of the total number of embryos transferred.

Induced or therapeutic abortion. A surgical or other medical procedure used to end a pregnancy.

IUI (intrauterine insemination). A medical procedure that involves placing sperm into a woman's uterus to facilitate fertilization. IUI is not considered an ART procedure because it does not involve the manipulation of eggs.

IVF (in vitro fertilization). An ART procedure that involves removing eggs from a woman's ovaries and fertilizing them outside her body. The resulting embryos are then transferred into a woman's uterus through the cervix.

Laparoscopy. A surgical procedure in which a fiber-optic instrument (a laparoscope) is inserted through a small incision in the abdomen to view the inside of the pelvis.

Live birth. The delivery of one or more infants with any signs of life.

Male factor. Any cause of infertility due to low sperm count or problems with sperm function that makes it difficult for a sperm to fertilize an egg under normal conditions.

Miscarriage (also called spontaneous abortion). A pregnancy ending in the spontaneous loss of the embryo or fetus before 20 weeks of gestation, or before 18 weeks from the date of transfer if the pregnancy was achieved using ART.

Multifetal pregnancy reduction. A procedure used to decrease the number of fetuses a woman carries and improve the chances that the remaining fetuses will develop into healthy infants. Multifetal reductions that occur naturally are referred to as spontaneous reductions.

Multiple factors, female and male. A diagnostic category used when one or more female cause and male factor infertility are diagnosed.

Multiple factors, female only. A diagnostic category used when more than one female cause of infertility is diagnosed.

Multiple-fetus pregnancy. A pregnancy with two or more fetuses, determined by the number of fetal hearts observed on an ultrasound performed early in pregnancy (usually in the first trimester).

Multiple-infant birth. A pregnancy that results in the birth of more than one infant.

NASS (National ART Surveillance System). Web-based data collection system used by all ART clinics to report data for each ART procedure to CDC.

Oocyte. The female reproductive cell, also called an egg.

Oocyte/Embryo banking cycle. An ART cycle started with the intention of cryopreserving (freezing) all resulting oocytes/embryos for potential future use.

Other causes of infertility. These include immunological problems, chromosomal abnormalities, cancer chemotherapy, and serious illnesses.

Ovarian monitoring. The use of ultrasound and/or blood or urine tests to monitor follicle development and hormone production.

Ovarian stimulation. The use of drugs (oral or injected) to stimulate the ovaries to develop follicles and eggs.

Ovulatory dysfunction. A diagnostic category used when a woman's ovaries are not producing eggs normally. It includes polycystic ovary syndrome and multiple ovarian cysts.

PGD (preimplantation genetic diagnosis).

A technique combining advances in molecular genetics and ART. PGD allows physicians to identify various genetic diseases in the embryo (fertilized egg with several divisions) prior to implantation, that is, before the pregnancy is established. It is of special value for those who are at risk of having children with serious genetic problems.

Pregnancy (clinical). A pregnancy documented by ultrasound that shows a gestational sac in the uterus. For ART data collection purposes, pregnancy is defined as a clinical pregnancy rather than a chemical pregnancy (i.e., a positive pregnancy test).

Singleton. A single live-born infant.

Society for Assisted Reproductive Technology (SART). An affiliate of ASRM composed of clinics and programs that provide ART.

Sperm. The male reproductive cell.

Spontaneous abortion. See Miscarriage.

Stillbirth. The birth of an infant that shows no sign of life after 20 or more weeks of gestation, or 18 or more weeks from the date of transfer if the pregnancy was achieved using ART.

Stimulated cycle. An ART cycle in which a woman receives oral or injected fertility drugs to stimulate her ovaries to produce more follicles.

Thawed embryo cycle. Same as frozen embryo cycle.

Tubal factor. A diagnostic category used when the woman's fallopian tubes are blocked or damaged, making it difficult for the egg to be fertilized or for an embryo to travel to the uterus.

Ultrasound. A technique used in ART for visualizing the follicles in the ovaries, the gestational sac, or the fetus.

Unexplained cause of infertility. A diagnostic category used when no cause of infertility is found in either the woman or the man.

Unstimulated cycle. An ART cycle in which the woman does not receive drugs to stimulate her ovaries to produce more follicles. Instead, follicles develop naturally.

Uterine factor. A structural or functional disorder of the uterus that results in reduced fertility.

ZIFT (zygote intrafallopian transfer). An ART procedure in which eggs are collected from a woman's ovary and fertilized outside her body. A laparoscope is then used to place the resulting zygote (fertilized egg) into the woman's fallopian tube through a small incision in her abdomen.

APPENDIX C: ART CLINICS

Reporting ART Clinics for 2012, by State

If the clinic name has changed since 2012, the current name is listed in italics directly under the 2012 name. If the clinic location has changed since 2012, the clinic is listed alphabetically by the current city and state.

Clinic names preceded by the § symbol have reorganized or closed since 2012. Reorganization is defined as a change in ownership or affiliation or a change in at least two of the three key staff positions (practice director, medical director, or laboratory director). Contact the NASS Help Desk for current clinic information at 1-888-650-0822 or nass@westat.com.

Explanation of abbreviations for accrediting agencies used throughout this list:

CAP = College of American Pathologists, Reproductive Laboratory Accreditation Program

The Joint Commission = Formerly the Joint Commission on Accreditation of Healthcare Organizations (JCAHO)

NYSTB = New York State Tissue Bank Program

PLEASE NOTE that the Centers for Disease Control and Prevention (CDC) does not oversee any of these accreditation programs. For further information on how to contact accrediting organizations directly, see page 22.

Nonreporting ART Clinics for 2012, by State

The clinics listed below provided ART services and were in operation as of January 1, 2012 and accordingly were required to submit ART cycle data under the provisions of the Fertility Clinic Success Rate and Certification Act passed by the US Congress. These clinics either failed to submit data or did not provide verification by the clinic medical director that the tabulated success rates were correct, as required for publication.

Consumers who are aware of a clinic that was in operation in 2012 but is not included in this report's lists of either reporting or nonreporting clinics are encouraged to contact us with the complete name, mailing address, and telephone number of the clinic, by e-mail at cdcinfo@cdc.gov (Subject: ART) or by regular mail at CDC, ATTN: ART Surveillance and Research Team; 4770 Buford Highway, N.E.; Mail Stop F-74; Atlanta GA 30341-3717. Providing this information will help ensure that clinics that should be in the report will be included in upcoming years.

Clinic names preceded by the † symbol have closed since January 1, 2012.
