

Morbidity and Mortality

Weekly Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE

PUBLIC HEALTH SERVICE

Prepared by the **COMMUNICABLE DISEASE CENTER** MEIrose 4-5131

For release March 30, 1962

ATLANTA 22, GEORGIA

Vol. 11, No. 12

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED MARCH 24, 1962

INFLUENZA - No significant outbreaks of influenza-like illness have been reported this week. New Hampshire and Rhode Island have confirmed outbreaks of Influenza B, bringing the total number of States confirming influenza B to 40. Influenza A₂ (Asian) virus has been isolated from a single case in Oakland, California.

No community epidemics of A₂ Influenza have yet been identified. The first A₂ virus isolation was obtained from an isolated case in Oakland, California. (Note: The previous report of six A₂ virus isolations, MMWR, Vol. 11, No. 9, page 66, was in error. These represented cases with serologic titer rises only.)

POLIOMYELITIS - Four cases of poliomyelitis, three paralytic, were reported from four widely separated States for the week ending March 24.

Of the 46 paralytic cases reported thus far in 1962, 28 had onset since January 1. Eighteen cases represent delayed reports with onsets of illness in 1961.

The map on page 90 depicts by county of origin 26 of the cases of paralytic poliomyelitis with onset in 1962. The county of origin for two paralytic cases reported this week (from California and Iowa) are not yet known.

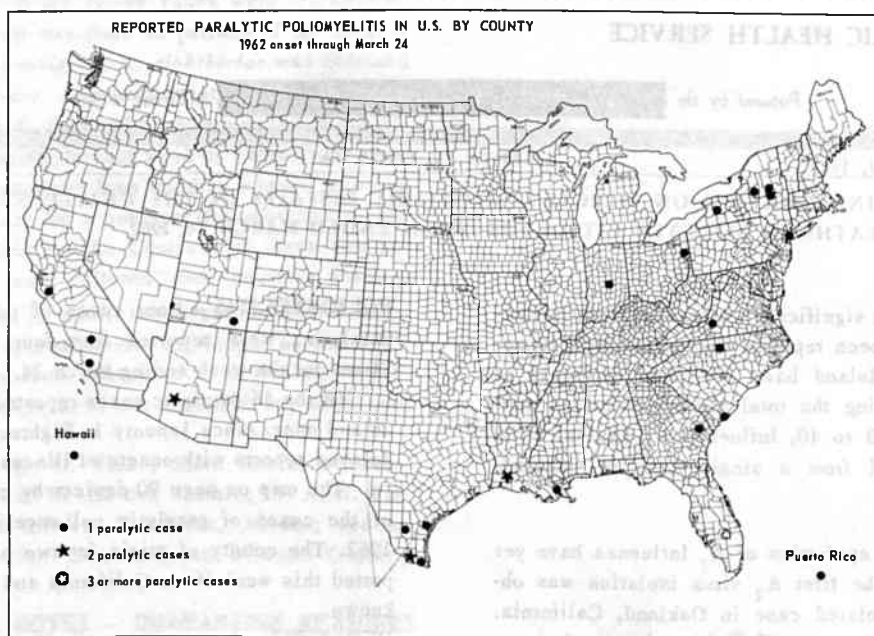

HEPATITIS - 1,227 cases of viral hepatitis were reported for the week ending March 24, 1962, as compared to 1,919 cases for the corresponding period in 1961.

Table 1. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES
 (Cumulative totals include revised and delayed reports through previous week)

EPIDEMIOLOGICAL REPORTS

Salmonellosis - Michigan

A notable epidemic in Detroit of food-borne *Salmonella thompson* infections has recently come to light. Following a report from Canada relating a marked increase in *S. thompson* infections to cake mixes, information regarding the 1961 occurrence of these organisms was sought from the 22 *Salmonella* typing centers in the country. The localization of 13 *S. thompson* cases to the Detroit region led to intensive studies in this area.

Eleven of these 13 persons had onset of illness due to *S. thompson* during the 10 hour period from 10:00 P.M. on July 22 to 8:00 A.M. on July 23. The other two cases could not be related to the epidemic. All of the 11 bacteriologically confirmed cases had ingested eclairs, obtained from a single neighborhood bakery, on July 22. Six to 18 hours after eating the eclairs, illness in these patients was heralded by explosive, blood-flecked diarrheal stools, continuous vomiting, intense abdominal cramps, and temperature elevations varying from 102° to 105° F. The sustained fluid loss led to profound fatigue and collapse. Seven persons required hospitalization. Therapy, consisting of replacement parenteral fluids, antispasmodics, and broad spectrum antibiotics, resulted in improvement within 24 hours and discharge of all hospitalized patients by the 7th day. Despite a three-week course of antibiotics, repeated cultures have yielded *S. thompson* for as long as 6 months in some of the patients.

Each of the bakery's employees submitted 2 stool specimens which when cultured were free from enteric pathogens. The list of ingredients used in the eclairs indicated that fresh eggs were the probable source of contamination. It was possible to trace the origin of the eggs through a route-man distributor, wholesaler and farm, to a single breeder source. This breeder had sustained losses of large numbers of newly hatched chicks due to an epizootic of *S. thompson* infections earlier in 1961. Investigations to ascertain the method of breeder flock infection or contamination are continuing.

(Reported by Dr. George H. Agate, Epidemiologist, Michigan Department of Health; Dr. G. D. Cummings, Director of Laboratory Services, Michigan Department of Health; Dr. Joseph G. Molner, Director, Detroit Health Department; and an EIS Officer from the Communicable Disease Center.)

Food-Borne Staphylococcus Enterotoxin Outbreaks

Twenty-seven outbreaks of gastroenteritis presumably due to staphylococcus enterotoxin are summarized on page 96. A total of 53 such outbreaks were reported during 1961 from 16 States, (See MMWR, Vol. 10, Nos. 12 and 27). The principal vehicles involved were sandwiches and salad preparations; and ham, turkey, and chicken, baked alone or in casseroles.

The interval between ingestion of the contaminated food and onset of symptoms varied between 1½ and 8 hours, as would be expected, in all cases except two (Case outbreaks Nos. 2 and 27) where intervals as long as 18 hours were recorded.

INTERNATIONAL NOTES - QUARANTINE MEASURES

Smallpox - Europe

Germany - Monshau Kreis (Land Nordrheinwestfalen) - Three additional cases of smallpox have been confirmed in this area, bringing the total of confirmed cases to 29, including 1 death.

Wales - Glamorganshire - A total of 17 confirmed cases of smallpox, including four deaths, has been reported to date. Eight cases, including three deaths, are from the Rhondda Urban District; nine cases, including one death, are from the Llanstrissant Rural District.

Immunization Information for International Travel

1961 edition - Public Health Service Publication No. 384
Section 5 - Add to the requirements:

ASIA - Pakistan, Page 47

Smallpox vaccination is required of departing travelers. Certificate is valid for three months, beginning 10 days after a primary vaccination or 3 days after a revaccination. A certificate indicating vaccination performed within 3 years will be accepted from transit passengers who remain less than 10 days in Pakistan.

Cholera vaccination is required of all arrivals from infected areas in Afghanistan.

All other information remains the same.

SUMMARY OF DEATHS AMONG PERSONS 65 YEARS AND OVER IN 108 U. S. CITIES

During the third four-week period of the current year ending March 24, there was an average weekly number of deaths of 7,053 as compared with a weekly average of 6,992 during the second four-week period and 7,136 during the first four-week period.

During this past four-week period, the number of deaths fell to expected levels in the last week of the period, bringing the average weekly excess to 305 for the four weeks. During the 1960 influenza A₂ epidemic, the average weekly excess number of deaths among older persons for the comparable four-week period was 435, and

similarly to the current period, the number of deaths fell markedly during the last week of the period.
