## Pneumococcal Immunization Program - California, 1986-1988

Pneumococcal infections are an important cause of morbidity and mortality in the elderly. Many of these infections can be prevented through immunization with pneumococcal polysaccharide vaccine. In 1986, the Immunization Unit of the California State Department of Health Services (CSDHS) received state funding for a 2-year trial program of publicly funded pneumococcal immunizations for senior citizens and others at high risk for infection. This report summarizes the results of that program.

In the first year of the program, CSDHS distributed 58,060 doses of pneumococcal vaccine to 56 local health departments. To promote the vaccine, the local health departments were encouraged to use either of two strategies:

Provide the vaccine during scheduled fall influenza clinics. Each fall, up to 500,000 California residents (primarily persons $\geqslant 65$ years of age) receive publicly purchased influenza vaccine through local health department-sponsored outreach clinics, health-center clinics, and nursing and convalescent homes. Promoting and providing pneumococcal vaccine at these sites simultaneously with influenza vaccine would enable health-care providers to vaccinate optimal numbers of senior citizens.

Provide the vaccine through other scheduled health department clinics. Where pneumococcal vaccine could not be provided at influenza clinics (e.g., because adequate staff were not available), local health departments were encouraged to promote pneumococcal immunizations through leaflets, posters, and staff recommendations, with subsequent referrals either to a specific pneumococcal vaccine clinic held by the health department at a later date or to a publicly funded preventive health-care clinic for the aging.

From July 1986 through June 1987, the 56 participating departments administered $24,280(41.8 \%)$ of the 58,060 -dose inventory of pneumococcal vaccine.* Twenty of the departments administered 13,604 ( $60.9 \%$ ) of 22,354 pneumococcal vaccine doses during their influenza clinics (Table 1). Twenty-four departments promoted pneumococcal immunization at their influenza clinics but referred patients to other locations, where 5982 ( $31.9 \%$ ) of 18,756 doses were administered. Nineteen departments that neither provided nor promoted the pneumococcal vaccine at their fall influenza clinics administered 4694 ( $27.7 \%$ ) of 16,950 doses (Table 1).

In the program's second year, the Immunization Unit developed special promotional materials to assist local health departments and emphasized administering pneumococcal vaccine at influenza clinics. From July 1987 through June 1988, 59

[^0]Pneumococcal Immunization - Continued
local health departments administered 44,257 (64.1\%) of 69,054 doses of pneumococcal vaccine - an $82.3 \%$ increase over the number of doses administered in the first year. Subsequently, the CSDHS secured an ongoing annual state appropriation to purchase pneumococcal vaccine.
Reported by: DO Lyman, MD, State Epidemiologist, California State Dept of Health Svcs. Div of Bacterial Diseases, Center for Infectious Diseases; Div of Immunization, Center for Prevention Svcs, CDC.
Editorial Note: Pneumococcal polysaccharide vaccine is recommended for 1) adults with chronic illnesses, especially cardiovascular and chronic pulmonary diseases; 2) adults with chronic illnesses (e.g., splenic dysfunction or anatomic asplenia, Hodgkin disease, multiple myeloma, cirrhosis, alcoholism, and renal failure) specifically associated with increased risk for pneumococcal disease or its complications; 3) adults with cerebrospinal fluid leaks and conditions associated with immunosuppression; and 4) otherwise healthy persons $\geqslant 65$ years of age (1).

Despite these recommendations, in $1985<10 \%$ of the estimated 47.9 million persons considered to be at high risk for pneumococcal infections reported having ever received pneumococcal vaccine (CDC, United States Immunization Survey, unpublished data, 1985). The 1990 national objective for pneumococcal vaccine coverage in high-risk groups is $60 \%$. Although vaccine and administration costs are reimbursed under the Medicare program, this objective is unlikely to be met nationwide (2).

| 1987-88 | - | (74.6) | - | (25.7) | - | (41.0) | - | ( 64.1) |

*Vaccine allocations to local health departments were determined by the estimated proportion of persons aged $\geqslant 65$ years residing in each county.

Pneumococcal Immunization - Continued
Each year in the United States, pneumococcal infection causes an estimated $150,000-570,000$ cases of pneumonia, $16,000-55,000$ cases of bacteremia, and $2600-6200$ cases of meningitis (3) and causes or contributes to 40,000 deaths. The 23 -valent polysaccharide vaccine contains capsular types that cause $88 \%$ of bacteremic pneumococcal disease (1). Pneumococcal vaccine is estimated to be $60 \%$ efficacious in clinical groups at moderate to high risk for infection, although two recent studies in veterans' hospitals failed to demonstrate efficacy in high-risk veterans (1). Assuming an overall vaccine efficacy of $60 \%$ with $60 \%$ coverage, an estimated 12,000 deaths related to pneumococcal disease might be prevented annually (3).

The success in increasing pneumococcal vaccine coverage in California may be directly related to efforts to encourage local health departments to both offer and administer the vaccine at public influenza immunization clinics. This approach appears to be more effective than promotion of pneumococcal vaccine during influenza immunization clinics with subsequent referral of prospective vaccinees to other sites for vaccination. These findings are consistent with a previous study that indicated that influenza vaccination programs can be used to identify candidates for whom pneumococcal vaccine, other vaccines, and toxoids are recommended (4).

Recommendations for pneumococcal immunization from health-care providers can influence a patient's decision to be vaccinated, even when the patient initially has a negative perception of the vaccine or its benefits (5). Therefore, health-care providers should assess each patient's immunization status and, when indicated, provide influenza and pneumococcal vaccines as well as other vaccines recommended for adults (diphtheria and tetanus toxoids and measles-mumps-rubella and hepatitis $B$ vaccines) $(6,7)$.

## Weight-Loss Regimens Among Overweight Adults Behavioral Risk Factor Surveillance System, 1987

To reduce the prevalence of overweight and related chronic diseases in the United States, the 1990 national health objectives proposed that "by 1990, 50 percent of the overweight population should have adopted weight loss regimens, combining an appropriate balance of diet and physical activity" (1). Data from 33 health departments ( 32 states and the District of Columbia) that participated in the 1987 Behavioral Risk Factor Surveillance System (BRFSS) were used to evaluate state-specific prog-

## Weight-Loss Regimens - Continued

ress toward achieving this objective. The BRFSS collects data on behavioral risk factors through random-digit-dialed telephone interviews of adults $\geqslant 18$ years old (2).

Prevalence estimates of weight-loss regimens among overweight persons were derived from self-reported data. Survey respondents were asked if they were trying to lose weight. Those responding affirmatively were also asked if they were eating fewer calories and if they were increasing physical activity to lose weight. Based on their answers, respondents were classified as eating fewer calories, increasing physical activity, or doing both. Overweight was defined as a body mass index (BMI = weight $[\mathrm{kg}] /$ height $\left.[\mathrm{m}]^{2}\right) \geqslant 27.8$ for men and $\geqslant 27.3$ for women. These values represent the sex-specific 85th percentile of BMI for U.S. adults aged 20-29 years, as estimated from the Second National Health and Nutrition Examination Survey (3).

The median prevalence of using the recommended weight-loss regimen (eating fewer calories and increasing physical activity) was $20.2 \%$ for overweight men and $31.4 \%$ for overweight women. Among men, the prevalence ranged from $12.9 \%$ in

*Mortality data in this table are voluntarily reported from 121 cities in the United States, most of which have populations of 100,000 or more. A death is reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not included.
**Pneumonia and influenza.
†Because of changes in reporting methods in these 3 Pennsylvania cities, these numbers are partial counts for the current week. Complete counts will be available in 4 to 6 weeks.
$\dagger \dagger$ Total includes unknown ages.
§Data not available. Figures are estimates based on average of past available 4 weeks.

Weight-Loss Regimens - Continued
Maine to $35.5 \%$ in Missouri (Table 1). For women, the prevalence ranged from 19.1\% in the District of Columbia to $41.9 \%$ in Utah (Table 2).

The median prevalence of eating fewer calories to lose weight was $43.6 \%$ among overweight men and 63.9\% among overweight women. For men, the prevalence ranged from 30.6\% in Rhode Island to $57.7 \%$ in Missouri (Table 1). Among women, the prevalence ranged from $47.7 \%$ in New Mexico to $72.3 \%$ in South Dakota (Table 2).

The median prevalence of increasing physical activity to lose weight was 24.3\% for overweight men and $34.7 \%$ for overweight women. Among men, the prevalence ranged from $16.8 \%$ in North Carolina to $38.6 \%$ in Missouri (Table 1). For women, the prevalence ranged from $23.4 \%$ in Ohio to $50.7 \%$ in Utah (Table 2).
Reported by: The following BRFSS coordinators: R Strickland, Alabama; T Hughes, Arizona; L Parker, California; M Rivo, District of Columbia; S Hoecherl, Florida; JD Smith, Georgia; E Tash, Hawaii; J Mitten, Idaho; B Steiner, Illinois; S Joseph, Indiana; K Bramblett, Kentucky; R Schwartz, Maine; A Weinstein, Maryland; L Koumijian Yandel, Massachusetts; N Salem, Minnesota; N Hudson, Missouri; R Moon, Montana; R Thurber, Nebraska; K Zaso, New Hampshire; L Pendley, New Mexico; H Bzduch, New York; C Washington, North Carolina; B Lee, North Dakota; E Capwell, Ohio; J Cataldo, Rhode Island; D Lackland, South Carolina; L Post, South Dakota; D Riding, Tennessee; J Fellows, Texas; C Chakley, Utah; K Tollestrup, Washington; $R$ Anderson, West Virginia; and R Miller, Wisconsin. Div of Nutrition and Office of Surveillance and Analysis, Center for Chronic Disease Prevention and Health Promotion, CDC.
Editorial Note: Previous studies have indicated that an effective weight-loss regimen incorporates both reduced caloric intake and increased physical activity (4,5). The BRFSS data suggest that no state will meet the 1990 objective to have $50 \%$ of the overweight population adopt this regimen. The use of physical activity appears to be the limiting factor. More than half of the overweight adults surveyed were eating fewer calories to lose weight, but less than one third were increasing physical activity. Moreover, only $25 \%$ of overweight adults were using both caloric restriction and increased physical activity to lose weight. Men were less likely than women to be using any weight-loss regimen. There is no apparent association between weight-loss regimens and state-specific prevalence of overweight (6).

The low prevalence of increasing physical activity to lose weight may reflect 1) the sedentary lifestyle of U.S. adults (7) and 2) the emphasis on diet as a means of weight loss without adequately addressing the benefits of physical activity. The benefits of combining physical activity with diet education are demonstrated by the Zuni Diabetes Project (8). Participants in an ongoing exercise-education program lost a mean of 9 pounds, compared with a mean loss of 2 pounds for nonparticipants (9). As in this project, public health agencies and health-care providers should incorporate conveniently scheduled exercise classes, on-site health education and health assessment, reward incentives, and community involvement into weight-control programs.

## Clarification: Vol. 38, No. 29

Table 2 of the article "Chronic Disease Reports: Deaths from Lung Cancer - United States, 1986," calculated population-attributable risks and attributable deaths separately for current and former smokers. Results indicated the proportions and numbers of deaths caused by current smoking (assuming the absence of former smoking) and of former smoking (assuming the absence of current smoking). Methods are available (1) to calculate the attributable risks for current and former smoking separately and combined. Overall, $86.7 \%$ of lung cancer deaths are attributable to cigarette smoking, 64.4\% in current smokers, $22.3 \%$ in former smokers.

Penalty for Private Use $\$ 300$

[^0]:    *Remaining doses were available for use in 1987-88; pneumococcal vaccine has a shelf life of 2 years from date of manufacture.

[^1]:    ${ }^{*}$ Because AIDS cases are not received weekly from all reporting areas, comparison of weekly figures may be misleading.
    ${ }^{\dagger}$ One of the 128 reported cases for this week was imported from a foreign country or can be directly traceable to a known internationally imported case within two generations.

[^2]:    *Defined as body mass index ( $\mathrm{Wt}[\mathrm{kg}] / \mathrm{Ht}[\mathrm{m}]^{2}$ ) $\geqslant 27.8$ for men.
    ${ }^{\dagger}$ Defined as eating fewer calories and increasing physical activity.
    ${ }^{5}$ Confidence interval.

[^3]:    The Morbidity and Mortality Weekly Report is prepared by the Centers for Disease Control, Atlanta, Georgia, and available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, (202) 783-3238.

    The data in this report are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. The editor welcomes accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials. Such reports and any other matters pertaining to editorial or other textual considerations should be addressed to: Editor, Morbidity and Mortality Weekly Report, Centers for Disease Control, Atlanta, Georgia 30333; telephone (404) 332-4555.
