485 Epidemiology in Action Course

## Epidemiologic Notes and Reports

## Measles - Washington, 1990

During the first 26 weeks of 1990, a total of 266 measles cases* (incidence: 5.8 cases per 100,000 population) was reported to the Washington State Department of Health from $15(38 \%)$ of the state's 39 counties. This number is nearly five times the total reported statewide during all of 1989 ( 55 cases) and is the largest number of cases reported by the state during any year since 1979. Seventy-five (28\%) of the reported cases were serologically confirmed. Detailed data were available for 218 cases reported during the first 22 weeks of 1990.

Of the 218 cases, 97 ( $45 \%$ ) were in Hispanics ( 58 cases per 100,000); 14 ( $6 \%$ ), American Indians ( 20 cases per 100,000); $100(46 \%)$, non-Hispanic whites ( 3 cases per 100,000 ); five ( $2 \%$ ), blacks ( 3 cases per 100,000); and two ( $1 \%$ ), Asians ( 1 case per 100,000). Of the 97 Hispanic patients, 70 ( $72 \%$ ) were Mexican citizens and 27 ( $28 \%$ ) were U.S. citizens (Table 1).
*Illness with generalized rash lasting $\geqslant 3$ days, temperature $\geqslant 38.3 \mathrm{C}(\geqslant 101 \mathrm{~F})$, and cough or coryza or conjunctivitis.

TABLE 1. Vaccination status of reported measles patients, by ethnic group Washington, January 1-May 31, 1990

| Ethnic group | Unvaccinated, vaccine indicated* |  | Unvaccinated, vaccine not indicated ${ }^{\dagger}$ |  | Vaccinated ${ }^{\text {5 }}$ |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | No. | (\%) | No. | (\%) | No. | (\%) | No. | (\%) |
| Hispanic |  |  |  |  |  |  |  |  |
| Mexican citizen | 45 | (64.3) | 19 | (27.1) | 6 | ( 8.6) | 70 | (100.0) |
| U.S. citizen | 5 | (18.5) | 17 | (63.0) | 5 | (18.5) | 27 | (100.0) |
| Non-Hispanic | 48 | (39.7) | 35 | (28.9) | 38 | (31.4) | 121 | (100.0) |
| Total | 98 | (45.0) | 71 | (32.6) | 49 | (22.5) | 218 | (100.0) |

* $\geqslant 16$ months of age, born in or after 1957, no evidence of immunity, and no medical contraindications.
${ }^{\dagger}<16$ months of age, born before 1957, religious/philosophic exemption, or medical contraindications.
${ }^{5}$ Vaccinated with live measles vaccine on or after first birthday.

Measles - Continued
One hundred one (46\%) patients were $<5$ years of age, including 51 aged $<16$ months; 50 ( $23 \%$ ) were aged 5-19 years; 67 ( $31 \%$ ) were aged $\geqslant 20$ years, including 16 who were born before 1957 (Table 2). Children $<5$ years of age had the highest age-specific incidence rate ( 29.2 per 100,000) (Table 2). Of the 97 Hispanic patients, 59 ( $61 \%$ ) were $<5$ years of age, including 32 who were $<16$ months of age.

Forty-nine ( $23 \%$ ) patients had been vaccinated, including three who were vaccinated 2,3 , and 10 days, respectively, after exposure (Table 1). Of the 169 unvaccinated patients, 98 ( $58 \%$ ) should have received vaccine according to routine indications ${ }^{\dagger}, 54$ ( $32 \%$ ) were $<16$ months of age, 11 ( $7 \%$ ) were born before 1957, and six ( $4 \%$ ) had religious or philosophic exemptions. Of the 98 unvaccinated patients for whom vaccine was indicated, 45 ( $46 \%$ ) were Hispanic Mexican citizens, five (5\%) were Hispanic U.S. citizens, 46 ( $47 \%$ ) were non-Hispanic U.S. citizens, and two (2\%) were non-Hispanic visitors from other countries.

Fifteen (7\%) cases were in persons infected in Mexico and were linked to 41 (19\%) additional cases. Sixteen cases were in persons from other states and were linked to two additional cases.

At least 37 (17\%) persons acquired measles through exposure in medical settings (three in physicians' offices, four on hospital wards, and 30 in emergency rooms). These persons included 16 medical workers, who infected at least six other persons (including three hospital patients). Serosurveys conducted at two hospitals as part of vaccination programs indicated that 119 (7\%) of 1698 employees lacked immunity as defined by enzyme-linked immunosorbent assay. None of the 19 hospitals where patients were treated had an employment policy requiring measles immunity.

Many patients with measles were not isolated promptly because of initial misdiagnosis. At least nine measles patients at three hospitals presented with fever, cough, conjunctivitis, and rash but were initially diagnosed as having hepatitis, viral syndrome, drug reaction, or Kawasaki disease. They remained in emergency rooms for up to 13 hours, were hospitalized without isolation, or were sent home where additional exposures occurred in family members. At least 31 cases in family members, other hospital patients, visitors, or staff were linked to these nine patients.

[^0]TABLE 2. Estimated incidence rates* of reported measles cases, by patient age group - Washington, January 1-May 31, 1990

| Age (yrs) | No. | (\%) | Rate |
| :---: | ---: | :--- | ---: |
| $0-4$ | 101 | $(46.3)$ | 29.2 |
| $5-9$ | 14 | $(6.4)$ | 4.1 |
| $10-14$ | 12 | $(5.5)$ | 4.0 |
| $15-19$ | 24 | $(11.0)$ | 7.3 |
| $20-24$ | 31 | $(14.2)$ | 9.2 |
| $25-29$ | 14 | $(6.4)$ | 3.6 |
| $\geqslant 30$ | 22 | $(10.1)$ | $<1.0$ |
| Total | 218 | $(100.0)$ | 4.7 |

*Per 100,000 population, based on 1988 population estimates.

Measles - Continued
Two persons aged 30 and 36 years, respectively, died from measles-related pneumonia (case-fatality rate: 9.2 deaths per 1000 cases), representing the first measles-related deaths in Washington since 1978. Fifty-nine (27\%) patients were hospitalized for a total of 236 days.

To control this epidemic, the Washington State Department of Health provided $>76,000$ doses of measles vaccine, at a cost of $\$ 1.1$ million, for use in vaccination clinics. These clinics were publicized in Spanish and English on radio and television, in newspapers, and by sound trucks driven through areas having a high proportion of Hispanic residents. In one severely affected county, the recommended age for measles vaccination was lowered to 12 months. In addition, susceptible students and staff were excluded from attendance at all 15 schools where at least one case occurred; at 13 of these schools, there was no evidence of secondary transmission. At one of the two schools where secondary transmission occurred, all students were vaccinated.

Reported by: L Jecha, MD, Benton-Franklin Health District; R Alexander, MD, Seattle-King County Dept of Public Health; C Winegar, Tacoma-Pierce County Health Dept; M Patnode, R Atwood, MD, Yakima Health District; R Nelson, B Baker, Immunization Program Office, JM Kobayashi, MD, State Epidemiologist, Washington State Dept of Health. Div of Field Svcs, Epidemiology Program Office, CDC.
Editorial Note: Two factors that contribute to the occurrence of measles outbreaks in the United States are the continuing importation of measles and the transmission of measles in medical settings (1-4). In the Washington epidemic, $26 \%$ of cases were acquired in Mexico or epidemiologically linked to these cases. In contrast, in the United States in 1989, 3\% of cases were associated with importations (5). Seventeen percent of cases in the Washington epidemic were acquired in medical settings.

In Washington, Hispanics constitute 4\% of the total population and are the largest ethnic minority group in the state. From 1980 through 1988, Washington's Hispanic population increased by an estimated $39 \%$ (6). Although measles vaccination coverage for the state's total Hispanic population is unknown, the high attack rate for Hispanics suggests that coverage is low.

Nearly half the cases in this epidemic occurred among unvaccinated persons for whom vaccine was indicated. Of these unvaccinated persons, more than half were Hispanic. Although vaccination programs should target all eligible persons, unique measles vaccination strategies are needed in those areas of the United States with large numbers of Hispanic persons who are recent immigrants, preschool-aged children, or undocumented residents. Vaccination clinics at churches and workplaces might reach undocumented residents who are reluctant to go to health departments or physicians' offices for vaccination. Any strategy should account for the potential reluctance of undocumented residents to have contact with government agencies.

Nosocomial transmission of measles continues to occur in the United States, in large part because measles cases are often not diagnosed and isolated promptly and because many medical workers are not immune (3,7). As in previous epidemics, a large proportion of the nosocomial transmission in Washington occurred in emergency rooms (3), possibly because emergency rooms are the primary source of medical care for many persons. Medical providers must be familiar with the clinical and epidemiologic features of measles, so that cases will be recognized promptly and patients isolated.

In Washington, the lack of hospital employment policies requiring immunity to measles accounted for disease in medical workers, major disruptions in staffing, substantial expenses for serologic testing and vaccination during the outbreak, and transmission from medical workers to others. In December 1989, Immunization Practices Advisory Committee (ACIP) recommendations were published that advised medical facilities to require all staff who will have direct patient contact to provide evidence of two live measles vaccinations, documentation of physician-diagnosed measles disease, or laboratory evidence of immunity (8).

Progress in Chronic Disease Prevention

## State Coalitions for Prevention and Control of Tobacco Use

In October 1989, the Association of State and Territorial Health Officials (ASTHO) collected information on state* coalitions for prevention and control of tobacco use from all 50 states and the District of Columbia (1). State representatives for prevention and control of tobacco use submitted information describing their coalition's membership, history, funding, and activities. This report summarizes the basic characteristics and key activities of these coalitions.

As of December 31, 1989, 47 states had coalitions that addressed prevention and control of tobacco use. Hawaii, Kentucky, Mississippi, and South Carolina did not have state-level coalitions. Of the 47 coalitions, 44 concentrated exclusively on prevention and control of tobacco use; the remaining three also addressed other chronic diseases. In 1963, Colorado established the first state tobacco-related coalition; most (28) states established coalitions after 1984. Twenty coalitions reported receiving funding ${ }^{\dagger}$, and 10 of these reported receiving in-kind state support for clerical and administrative needs (Table 1).

Tobacco Use - Continued
All coalitions included a representative from the state public health agency as well as other health professionals (e.g., physicians, nurses, health researchers, and/or hospital administrators). Coalition members represented volunteer, community, policy-relevant, and education groups. In some states, coalitions also included economists (Florida, Michigan, and Vermont), military officials (Alabama, Alaska, and Delaware), representatives from the tobacco industry (Maine), vendor organizations (Indiana and Vermont), youth groups (Maine, Massachusetts, Montana, New York, and Vermont), sports groups (Delaware, Michigan, and Vermont), and veterans groups (Alabama, Minnesota, and Vermont).

The most frequently reported coalition activities were 1) providing public education and information ( 34 states), 2) lobbying for antitobacco legislation ( 25 states), 3 ) educating health-care professionals ( 21 states), 4) developing and implementing a state plan for tobacco control (18 states), and 5) conducting research and evaluation (12 states) (Table 2). Other reported activities included promoting a Smoke-Free Class of 2000 (cosponsored by the American Lung Association, the American Heart Association, and the American Cancer Society [ACS]) (Illinois, Minnesota, and New Hampshire), advising the state health department (New York and Ohio), and antitobacco advertising (Colorado).
Reported by: State specialists for prevention and control of tobacco use. KM Marconi, PhD, Public Health Applications Br, National Cancer Institute; GC Bennett, MPH, Health Education Br, National Heart, Lung, and Blood Institute, National Institutes of Health. Program Svcs Activity, Office on Smoking and Health, Center for Chronic Disease Prevention and Health Promotion, CDC.
Editorial Note: Direct community involvement is essential to achieve a smoke-free society by the year 2000. State coalitions for prevention and control of tobacco use bring together a broad range of persons and organizations to reach a common goal: reducing the prevalence of tobacco use. Coalitions can amplify state resources by involving community groups, volunteer organizations, advocacy groups, educators, and representatives of target populations. Leadership from physicians and other health officials is needed to ensure the success of community coalitions.

State coalitions for prevention and control of tobacco use should set specific, measurable objectives that enhance the strength and credibility of the coalitions' immediate plans, as well as maintain support for long-term public health efforts (2). Coalitions should provide direction for the development of state plans for prevention and control of tobacco use, enlist political and constituent support, ensure input from special target groups, and provide technical expertise in advising policymakers. These issues are discussed in more detail in the Guide to Public Health Practice: State Health Agency Tobacco Prevention and Control Plans (3).

The American Stop Smoking Intervention Study (ASSIST), sponsored by the ACS and the National Cancer Institute ( NCI ), National Institutes of Health (NIH), will provide additional funding to approximately 15 states or large municipalities to support coalition initiatives for prevention and control of tobacco use (1). Agencies working through a national network of state public health professionals to increase public health efforts to prevent and control tobacco use at the state level include ASTHO; CDC's Office on Smoking and Health, Center for Chronic Disease Prevention and Health Promotion; and NCl and the National Heart, Lung, and Blood Institute (NHLBI), NIH (4).

Additional information on developing tobacco-related coalitions is available in With Every Beat of Your Heart, published by NHLBI (5), and Smoke Fighting: A Smoking Control Movement Building Guide, published by ACS (2 ).

Notices to Readers

## Availability of Primaquine Phosphate from CDC

Primaquine phosphate is an antimalarial drug that decreases the risk of malaria relapses by acting against the liver stages of Plasmodium vivax and P. ovale infections. No alternative antirelapse drugs are available in the United States.

CDC was recently notified by the sole U.S. manufacturer of primaquine (Winthrop Pharmaceuticals, New York, New York) that production of this drug has been temporarily discontinued because its chemical precursor is currently unavailable. Primaquine is expected to be commercially available again in mid-1991. In the meantime, CDC has acquired a supply of the drug in sufficient quantity for treatment of nonmilitary cases of $P$. vivax and $P$. ovale infections. Until primaquine is again commercially available, CDC will provide this drug free to licensed U.S. physicians who wish to prescribe it for patients who have parasitologically-confirmed $P$. vivax or P. ovale infections and who reside in the United States or its territories. Patients with $P$. falciparum or $P$. malariae infections do not require primaquine therapy. Because of the limited supply, CDC is unable to provide primaquine for persons who wish to use it as part of a chemoprophylactic regimen.

Physicians who wish to receive therapeutic courses of primaquine for their patients should call the CDC Drug Service at (404) 639-3670, Monday through Friday, between 8:00 a.m. and 4:30 p.m. Eastern time. Physicians will be requested to provide the following information about their patients: clinical and parasitologic data, places and dates of travel to malarious areas, and use of malaria chemoprophylaxis.

## Epidemiology in Action Course

CDC and Emory University will cosponsor a course designed for practicing state and local health department professionals. This course, "Epidemiology in Action," will be held at CDC November 5-16, 1990. It emphasizes the practical application of epidemiology to public health problems and will consist of lectures, workshops,

Epidemiology in Action - Continued
classroom exercises (including actual epidemiologic problems), roundtable discussions, and an on-site community survey. Applications must be received by August 24. For further information and/or an application form, contact Department PSB, Division of Public Health, Emory University, 1599 Clifton Road, N.E., Atlanta, GA 30329; telephone (404) 727-0199; FAX (404) 727-8744; TELEX (810) 751-8512.

The Morbidity and Mortality Weekly Report is prepared by the Centers for Disease Control, Atlanta, Georgia, and available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, (202) 783-3238.

The data in this report are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. The editor welcomes accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials. Such reports and any other matters pertaining to editorial or other textual considerations should be addressed to: Editor, Morbidity and Mortality Weekly Report, Centers for Disease Control, Atlanta, Georgia 30333; telephone (404) 332-4555.
