Progress in Chronic Disease Prevention

Chronic Disease Control Activities of Medical and Dental Organizations

A meeting of representatives of selected medical and dental organizations was convened by the Clinical Services Branch, Office of Disease Prevention and Health Promotion, Public Health Service, U.S. Department of Health and Human Services, in September 1987 to discuss future directions for implementing preventive services in clinical settings.* Organizations were asked to report on their current activities in disease prevention and health promotion. These reports indicate that organized medicine and dentistry are offering a variety of programs to prevent and control chronic diseases in the United States.

Periodic Health Examinations

Several organizations have issued recommendations on screening for reversible risk factors and early disease. The American Academy of Pediatrics (AAP) has published periodic updates of its recommendations for well-child care, *Guidelines for Health Supervision*. The American College of Obstetricians and Gynecologists (ACOG) has published "Technical Bulletins" on gynecologic cancer screening and, in cooperation with AAP, on perinatal care. The scientific basis for various components of periodic health examinations is being evaluated by the American College of Physicians (ACP) as part of its Clinical Efficacy Assessment Program. Other organizational programs have emphasized selected aspects of periodic health examinations. For example, the American Academy of Family Physicians (AAFP) cosponsors with the American Society of Gastrointestinal Endoscopists a training program on flexible sigmoidoscopy for family physicians. *The Journal of the American Medical*

^{*}Participating members: Herbert F. Young, MD, Kenneth W. Whittington, MD (American Academy of Family Physicians); Karen Palchick, LPN, Kenneth O. Johnson, MD (American Academy of Pediatrics); Shirley Shelton, John T. Queenan, MD (American College of Obstetricians and Gynecologists); Margaret Radany, MD (American College of Physicians); William M. Kane, PhD, David Harris, MD (American College of Preventive Medicine); James Marshall, James V. Huerter, DDS (American Dental Association); Alan L. Engelberg, MD, Ray W. Gifford, Jr., MD (American Medical Association); Douglas Ward, PhD, Frederic N. Schwartz, DO (American Osteopathic Association).

Chronic Disease Control - Continued

Association (JAMA) has published background papers and recommendations issued by the U.S. Preventive Services Task Force on components of the periodic health examination.

Smoking Cessation

AAFP has developed for its members a package of smoking cessation materials, the Stop Smoking Kit, which includes medical records forms, waiting room posters, and information on smoking cessation counseling techniques. AAFP has produced a self-help booklet and audiotape for patients who wish to quit smoking. The dangers of smoking in pregnancy have been emphasized by ACOG in *The Standards for Obstetric-Gynecologic Services* and in its Technical Bulletin entitled "Cigarette Smoking and Pregnancy." The Clinical Efficacy Assessment Program of ACP has evaluated office-based smoking cessation methods. The American Medical Association (AMA) has worked for the creation of smoke-free public environments, and the American Dental Association (ADA) has sponsored professional and public education on the use of smokeless tobacco. Smoking cessation techniques have also been taught in continuing medical education programs of the American Osteopathic Association (AOA).

Injury Control

The Injury Prevention Program of AAP provides pediatricians with safety surveys, information sheets, and other materials to inform parents about childhood injury prevention. The American College of Preventive Medicine (ACPM) has produced continuing education materials on the prevention of motor-vehicle trauma. An AMA monograph, *Medical Conditions Affecting Drivers*, and a *JAMA* review by AMA staff on medical standards for civilian pilots (1) both focus on the prevention of injuries. AMA has held several conferences on injury prevention since 1983.

Immunizations

The Report of the Committee on Infectious Diseases (popularly known as the "Red Book"), published by AAP, and the *Guide for Adult Immunization* ("Green Book"), published by ACP, offer recommendations on pediatric and adult immunizations, respectively. ACPM has been part of a national initiative to promote adult immunization and, in particular, reimbursement through Medicare for pneumococcal vaccine.

Oral Health

ADA promotes the use of dental sealants, fluoridation of water systems, the prevention of caries associated with nursing bottles (in collaboration with AAP), and the prevention of dental complications from medical illness, including human immunodeficiency virus infection.

Other Areas

ACOG has developed Adolescent Sexuality: Guides for Professional Involvement, a manual for physicians working with schools and public education programs on unwanted teenage pregnancy. ACOG has also prepared technical bulletins on the prevention of osteoporosis. Other educational programs include the National High Blood Pressure Education Program and the National Cholesterol Education Program.

Implementation

Medical and dental organizations have also taken steps to facilitate the implementation of clinical preventive services. These efforts include professional education, patient and public education, and public policy changes, as follows:

Chronic Disease Control - Continued

Professional education. Education of health professionals at the undergraduate, graduate, and postgraduate levels is an important component of organizational initiatives in chronic disease prevention and control. AOA requires training in prevention beginning with the first year of undergraduate training and continuing through residency. AOA's continuing medical education courses have featured a number of prevention-related topics. Recent courses offered by AMA have included environmental risk assessment and the diagnosis and management of hyperlipidemia. ACPM cosponsors the PREVENTION conference series and also markets the "Dietary Inventory of Nutritional Experience," a computer software program that teaches physicians about nutrition and how to improve nutritional behavior. Both AAFP and AAP have organized numerous continuing medical education courses in prevention and regularly feature articles about health promotion and disease prevention in their respective journals, American Family Physician and Pediatrics.

Patient and public education. Many organizational chronic disease prevention and control projects include components on patient or public education. AAP's injury prevention program, for example, includes educational materials for patients. ACOG's efforts to prevent osteoporosis and unwanted teenage pregnancy include patient education pamphlets and television advertising. Patient education materials also have been produced by ACP, ADA, and AAFP.

Public policy. Numerous organizations have played an active role in advocating health-related changes in public policy. Child safety-seat laws were a focus of legislative action by AAP, and members of that association have testified before Congress on bills relevant to child health, have lobbied for improved access to health care for children, and have helped organize a child health advocacy coalition. ACOG has mounted policy initiatives on improved access to prenatal care and on contraceptive advertising. The expansion of community water fluoridation is a continuing concern of ADA. Several medical and dental organizations have worked together on various immunization policy questions.

Reported by: American Academy of Family Physicians, Kansas City, Missouri. American Academy of Pediatrics, Elk Grove Village, Illinois. American College of Obstetricians and Gynecologists, Washington, DC. American College of Physicians, Philadelphia, Pennsylvania. American College of Preventive Medicine, Washington, DC. American Dental Association, Chicago, Illinois. American Medical Association, Chicago, Illinois. American Osteopathic Association, Chicago, Illinois. Office of Disease Prevention and Health Promotion, Public Health Svc, Dept of Health and Human Svcs.

Editorial Note: The clinical setting offers an important opportunity for health professionals to provide services designed to control chronic disease (2). Clinicians, through their frequent contact with patients, have many opportunities to initiate disease prevention activities. In 1985, for example, the average American had contact with a physician 5.2 times (3). In addition to offering clinical preventive services such as screening tests, physicians can promote behavioral risk reduction through patient education and counseling (4). Clearly, the delivery of these preventive services during the clinical encounter serves an important public health role in the national strategy to prevent and control chronic disease (5,6).

At the same time, there are barriers to implementing preventive services in the clinical setting. There is evidence, for example, that physicians do not perform cancer screening and other preventive services in accordance with published recommendations (7,8). Despite these difficulties, however, physicians are beginning to adopt

Chronic Disease Control - Continued

primary and secondary prevention as legitimate concerns (9) and appear to have a better understanding of how to change medical practices to comply with recommendations (10). This report suggests that, at the organizational level, physicians and dentists are developing programs for professional education and support, educational materials for patients, public education campaigns, and various policy initiatives to promote the implementation of disease prevention activities on a national scale.

Epidemiologic Notes and Reports

Organophosphate Toxicity Associated With Flea-Dip Products — California

Flea-control products, particularly flea dips for pet animals, may contain potent cholinesterase-inhibiting organophosphate pesticides. In 1986 and 1987, two cases of human illness associated with the use of flea-dip products were reported to the California Department of Health Services (CDHS) and the California Department of Industrial Relations (CDIR). One patient was a pet groomer who requested advice from the state's Hazard Evaluation System and Information Service (HESIS). The other patient was also a pet groomer. She had had a long-term illness that was discovered by HESIS through a telephone survey.

Case 1

In early September 1986, a 33-year-old female pet groomer complained of periodic headache, nausea, dizziness, tiredness, and blurred vision and of sweating and feeling "confused" and "spaced out." For over a year, these episodes had occurred more frequently, and the symptoms had become more severe each time. According to her friends, her pupils were often pinpoint-sized during these episodes. At first, she thought her symptoms were due to stress at work, and she did not seek medical care.

For the preceding 18 months, she had been treating dogs with an organophosphate pesticide. During the summer months, she had treated an average of 10 dogs per day. The flea-dip product she used is a liquid concentrate containing 11.6% phosmet* (a cholinesterase-inhibiting organophosphate insecticide known to cause acute irritation of the mouth, eyes, and skin) as the active ingredient. While diluting the concentrate in water, she frequently had spilled some of the concentrate on her skin.

After consulting with HESIS, the woman's physician diagnosed her illness as organophosphate intoxication. Her red cell cholinesterase activity (0.84 Δ pH) was well within the usual range (0.56–1.01 Δ pH) found by the testing laboratory. The woman was treated with oral atropine, and her symptoms diminished. For 2 weeks after returning to work, she avoided contact with flea-dip solutions and remained asymptomatic; however, within an hour after she treated a dog with a product containing chlorpyrifos, † a mild-to-moderate cholinesterase-inhibiting agent, her symptoms recurred. After that, she avoided contact with all organophosphate pesticides. Seven months later, her level of red cell cholinesterase, measured by the same laboratory, was within 20% (0.67 Δ pH) of the first value.

Telephone Survey

Later in September 1986, HESIS conducted a telephone survey. Twenty-four pet groomers in the San Francisco Bay area and Los Angeles were selected at random from listings in telephone directories. Through telephone interviews, 12 persons reported that they frequently used flea-dip products and usually had symptoms when they worked with the products. The symptoms most commonly reported were headache, dizziness, nausea, fatigue, and dermatitis. Two persons reported having symptoms of sweating, tearing, and confusion, all of which are consistent with cholinesterase inhibition. Flea-control products containing phosmet were most often

^{*}N-(Mercaptomethyl)phthalimide S-(O,O-dimethylphosphorodithioate).

[†]O,O-Diethyl O-(3,5,6-trichloro-2-pyridyl)-phosphorothioate.

Toxicity - Continued

reported as being related to the symptoms. One person complained of symptoms while working with a product containing chlorfenvinphos,⁵ an organophosphate classified by the Environmental Protection Agency (EPA) as Toxicity Class I (1).[¶]

Most of the pet groomers reported that they did not wear aprons or gloves and did not use the pesticides according to directions on the product labels. They often applied the undiluted concentrates with bare hands, and their skin and eyes were frequently exposed to the flea-control products.

^{*}Mortality data in this table are voluntarily reported from 121 cities in the United states, most of which have populations of 100,000 or more. A death is reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not

more. A death is reported by the place of the destance included.
included.
**Pneumonia and influenza.
†Because of changes in reporting methods in these 3 Pennsylvania cities, these numbers are partial counts for the current week.
Complete counts will be available in 4 to 6 weeks.
††Total includes unknown ages.
§Data not available. Figures are estimates based on average of past available 4 weeks.

Toxicity - Continued

Case 2

One of the persons interviewed was a 43-year-old female dog groomer who had been treating 8–12 dogs each day for 3 years. She sponged a concentrated solution of flea-dip product directly onto flea-infested areas on the dogs. For a year, she had had periodic dizziness, fatigue, blackouts, blurred vision, chest pain, sweating, coldness, and chills. During these episodes, she had pinpoint-sized pupils. Because of the blackouts, her physician referred her to a neurologist, who observed that she had unequal pupils during one of these episodes. Diagnostic tests—including an electroencephalogram and a brain scan—did not reveal the cause of her symptoms. Pesticide poisoning was not suspected until HESIS referred her to a physician specializing in occupational medicine. Three months later, after she had completely avoided all exposure to the products, her red blood cell cholinesterase levels had gradually increased by more than 30%. The majority of her symptoms also resolved during this period. On the basis of this finding, her illness was diagnosed as organophosphate pesticide poisoning (2).

Further Investigations

CDHS is now conducting a statewide investigation of pet groomers and other animal handlers. The California Department of Food and Agriculture is evaluating the hazards, use, and labeling of all flea-control products containing phosmet.

Reported by: J Rosenberg, MD, SG Quenon, RN, Hazard Evaluation System and Information Svcs, California Dept of Health Svcs/Dept of Industrial Relations. Surveillance and Programs Br, Div of Environmental Hazards and Health Effects, Center for Environmental Health and Injury Control. CDC.

Editorial Note: HESIS, which was established in 1977 and is jointly supported by CDHS and CDIR, provides an "early warning system" for identifying occupational diseases and hazards. Since 1980, HESIS has assessed occupational hazards, provided health information to the public, and maintained surveillance for occupational illness and exposure. In 1986, HESIS responded to 2,429 inquiries.

EPA has assigned phosmet to Toxicity Class II because of acute oral toxicity $(LD_{50}=147 \text{ mg/kg})$ (1). In a recent review of registration data on pesticides, investigators found a lack of information on acute inhalation toxicity, subchronic dermal toxicity, mutagenicity, oncogenicity, and the general metabolism of phosmet (3). The low-level, acute dermal toxicity $(LD_{50}=3,160 \text{ mg/kg})$ suggests a low rate of dermal absorption, but quantitative data on dermal absorption—particularly of flea-dip formulations—are lacking.

EPA requires that products used as flea dips for dogs and cats must have labels cautioning the users to wear long-sleeved shirts, long pants, elbow-length waterproof gloves, waterproof aprons, and unlined waterproof boots. Because animals that have been dipped or sprayed with pesticides have become ill or have died, EPA now requires that the product label state that a dog or cat may be poisoned if the product is not properly diluted before use.

The extent to which animal handlers in the United States are exposed to or become ill from flea-control pesticides is unknown. Animal groomers and handlers should follow label directions precisely and should wear gloves and protective clothing as recommended.

Notices to Readers

Announcement of the Third National Conference on Chronic Disease Prevention and Control

CDC and the Association of State and Territorial Health Officials (ASTHO) will cosponsor the Third National Conference on Chronic Disease Prevention and Control, *Putting Science Into Practice*, October 19–21, 1988, at the Hyatt Regency Denver, in Denver, Colorado. The conference is open to the public; there will be no registration fee

The conference will build on the strategies identified by participants at the First and Second National Conferences on Chronic Disease Prevention and Control. Those two conferences placed particular emphasis on the interactions among federal, state, and local health departments; voluntary health agencies; professional organizations; and others.

This year's conference will include the following plenary sessions:

- Health Education/Mass Media Approaches for Changing Behaviors
- Preventive Health Services in Primary Care Settings (including the costeffectiveness of chronic disease prevention and control strategies)
- Long-Term/Broad Strategic Issues for Public Health Chronic Disease Control

Concurrent afternoon sessions will focus on breast cancer, cervical cancer, choleste-rol/cardiovascular disease, diabetes, and smoking.

Additional information may be obtained by contacting Martha S. Brocato, Division of Chronic Disease Control, Center for Environmental Health and Injury Control, Centers for Disease Control (F10), Atlanta, Georgia 30333; telephone: (404) 488-4251 or FTS 236-4251.

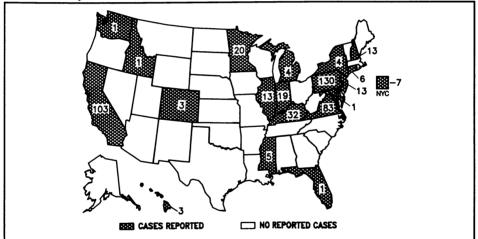

Malaria Prevention Information System

Information on prevention of malaria for travelers is now available 24 hours a day by calling (404) 639-1610. The information system, which is a CDC pilot project, gives general information about malaria and malaria prevention and detailed recommendations on malaria prevention in specific geographic areas (Africa, the Indian subcontinent, Mexico, Central America and the Caribbean, South America, China and Southeast Asia, and Oceania). Information on prevention of malaria in children and pregnant or breastfeeding women is also available. Callers can select any one or all of the informational messages and should be prepared to write down the names and dosages of drugs. The information will be updated as needed.

Erratum: Vol. 36, No. 6

p. 89–90 In the article entitled "PCB Contamination of Ceiling Tiles in Public Buildings — New Jersey," the second sentence of the third paragraph states: "In February 1986, a consultant hired by the college pursued the secretary's observation and evaluated ceiling tiles throughout the school." The sentence should read: "A consultant was hired by the college in January 1986, and the consultant's sampling and analysis of the ceiling tiles was under way at the time of the secretary's observation. The observations of both the secretary and the consultant occurred simultaneously and independently of each other."

FIGURE I. Reported measles cases - United States, Weeks 17-20, 1988

The Morbidity and Mortality Weekly Report is prepared by the Centers for Disease Control, Atlanta, Georgia, and available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, (202) 783-3238.

The data in this report are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. The editor welcomes accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials. Such reports and any other matters pertaining to editorial or other textual considerations should be addressed to: Editor, *Morbidity and Mortality Weekly Report*, Centers for Disease Control, Atlanta, Georgia 30333.

Director, Centers for Disease Control James O. Mason, M.D., Dr.P.H. Director, Epidemiology Program Office Carl W. Tyler, Jr., M.D. Editor Michael B. Gregg, M.D. Managing Editor Gwendolyn A. Ingraham
