## MORBIDITY AND MORTALITY WEEKLY REPORT

- 629 Playground-Related Injuries in Preschool-Aged Children – United States, 1983–1987  
 637 Ectopic Pregnancy – United States, 1984 and 1985

### Current Trends

#### **Playground-Related Injuries in Preschool-Aged Children – United States, 1983–1987**

From 1983 to 1987, nearly 6.72 million emergency room visits in the United States were for product-related injuries among preschool children 1–4 years old.\* Approximately 305,000 (4.5%) of these injuries involved playground equipment. These playground equipment-related injuries occurred most frequently at home (38.3%), in sports or recreation settings (29.4%), or at school (8.9%) (Table 1). Of the 82,108 injuries in preschool-aged children attending day care (coded as occurring at school), 27,232 (33.2%) were related to playground equipment (Table 1).

\*This estimate is based on data from the National Electronic Injury Surveillance System (NEISS) of the U.S. Consumer Product Safety Commission (CPSC). Sixty-two hospitals with emergency rooms located throughout the United States contribute to this data base. When weighted, the reports from NEISS reflect national estimates of persons with product-related injuries treated in hospital emergency rooms.

**TABLE 1. Playground-related and other injuries in preschool-aged children, by locale – United States, 1983–1987**

Locale	Playground-related injuries		Other injuries	
	No.	(%)	No.	(%)
Any home*	116,963	( 38.3)	5,262,909	( 82.1)
Sports or recreation setting	89,631	( 29.4)	74,269	( 1.2)
School	27,232	( 8.9)	54,876	( 0.9)
Other†	24,383	( 8.0)	350,972	( 5.5)
Unknown	47,072	( 15.4)	668,570	( 10.4)
<b>Total</b>	<b>305,281</b>	<b>(100.0)</b>	<b>6,411,596</b>	<b>(100.0)</b>

\*Includes injuries occurring inside or outside a house, farmhouse (not farm-related), apartment, condominium, or mobile home.

†Includes injuries occurring at a street, highway, store, office building, restaurant, church, farm, or industrial place.

*Injuries – Continued*

Most preschool-aged children with injuries involving school playground equipment were 3 or 4 years old and male (Table 2). A higher proportion of playground-related injuries occurred in the spring than at other times of the year (Table 2). Forty percent of playground-related injuries were associated with climbing apparatus, and two thirds of injuries were to the head and neck (Table 2).

Lacerations (38.5%), contusions or abrasions (26.8%), fractures (16.8%), strains or sprains (4.4%), and concussions (1.7%) were most commonly reported (Table 2). Head and neck injuries were primarily lacerations (55.7%) and contusions or abrasions (23.7%). Injury to the extremities and trunk included mostly fractures, contusions or abrasions, and strains or sprains (upper extremity—62.4%, 22.2%, and 12.2%; lower extremity—31.4%, 42.2%, and 15.4%; trunk—27.7%, 51.2%, and 9.2%, respectively). Approximately 5.3% of preschool-aged children treated in emergency rooms for playground-related injuries required hospitalization.

*Reported by: Div of Injury Epidemiology and Control, Center for Environmental Health and Injury Control, CDC.*

**Editorial Note:** By 1984, more than 11 million children attended day-care facilities (1). The potential injury hazards of organized day care and day-care playgrounds

**TABLE 2. School playground-related injuries in children aged 1–4 years, by selected items – United States, 1983–1987**

Characteristic	Playground-related injuries		Characteristic	Playground-related injuries	
	No.*	(%)		No.*	(%)
Age (yrs)			Location of injury

Other	2,905	(10.7)			

\*These are national estimates of product-related injuries treated in hospital emergency rooms using data from the National Electronic Injury Surveillance System.

<sup>†</sup>Excluding swimming pools and ground water slides.

<sup>§</sup>Including the face and mouth.

*Injuries – Continued*

have been documented (2–5). The NEISS data suggest that further improvements in playground safety are needed to reduce playground-related injuries.

NEISS provides a data base for estimating injuries associated with playground equipment in young children in day-care facilities. However, these data are limited in that, by using “school” as the location to represent day-care playgrounds, they exclude children injured in day care at a home, church, or building other than a school. Conversely, some injuries that reportedly took place at school possibly occurred to children using a school playground but not attending day care. Interpreting these data is also difficult because the type, size, and cost of equipment at a school playground differ from those used in homes, churches, or private day care. Thus, the distribution by type of equipment in the overall day-care environment may vary considerably from that described here.

A CPSC-sponsored hazard analysis showed that falls to the ground surface account for 60% of playground equipment-related injuries (6). A 1-foot fall directly on the head onto concrete or asphalt or a 4-foot fall onto packed earth can be fatal (7–9). In contrast, surfaces made of energy-absorbing mats or loose materials such as wood chips or sand may reduce the likelihood of head injury even from falls of 8 feet (7,8). Yet over 48% of day-care playground equipment is not installed over impact-absorbing surfaces (2,3). Although in some cases the Occupational Safety and Health Administration requires that guard rails be installed to protect workers as low as 4 feet above ground level, no such protective legislation exists for children on playground equipment, some of which is more than 10 feet above the ground (8).

Injury control programs should address the safety aspects of public and other playgrounds for all ages. According to NEISS data, 994,678 injuries in all age groups from 1983 to 1987 were associated with playground equipment; 243,807 (24.5%) of these injuries occurred at schools, and 257,070 (25.8%), at places of recreation. Recommendations to improve playground safety include installing playground equipment over energy-absorbing surfaces, locating the equipment away from obstructions, properly anchoring the equipment, checking the integrity of the equipment frequently, covering protrusions, removing broken equipment promptly, and instructing and supervising children in proper playground use (10,11). If wood chips or sand are used as surfacing, they should be well maintained and not allowed to compact or fall below an adequate depth. Limiting the height of playground equipment may also be helpful. Parents should consider the safety aspects of playgrounds in day-care centers, schools, and public areas before allowing their children to use them.

\*Mortality data in this table are voluntarily reported from 121 cities in the United States, most of which have populations of 100,000 or more. A death is reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not included.

\*\*Pneumonia and influenza.

†Because of changes in reporting methods in these 3 Pennsylvania cities, these numbers are partial counts for the current week. Complete counts will be available in 4 to 6 weeks.

††Total includes unknown ages.

§Data not available. Figures are estimates based on average of past available 4 weeks.

## Ectopic Pregnancy — United States, 1984 and 1985

In 1984, 75,400 ectopic pregnancies\* were reported in the United States, representing an increase of 8% over the number reported in 1983 (Table 1). In 1985, the number of ectopic pregnancies increased to 78,400, a 4% increase from the previous year. From 1970, when surveillance for ectopic pregnancy began, to 1985, the rate per 1000 reported pregnancies<sup>†</sup> more than tripled from 4.5 to 15.2 (Figure 1). Similarly, the rate of ectopic pregnancies per 1000 live births increased fourfold from 4.8 in 1970 to 20.9 in 1985, while the rate per 10,000 females of reproductive age (15–44 years) more than tripled from 4.2 in 1970 to 14.0 in 1985.

In 1984 and 1985, the highest rates of ectopic pregnancies (per 1000 reported pregnancies) occurred for women  $\geq 30$  years of age, as in previous years (1). Rates were approximately 50% higher for women of black and other races than for white women. Preliminary analysis by geographic region for 1984 and 1985 showed the highest rates of ectopic pregnancies in the Midwest and South, whereas in 1981–1983 the highest rates occurred in the West. For both time periods, the lowest rates occurred in the Northeast.

\*Data were obtained from the National Hospital Discharge Survey conducted by the National Center for Health Statistics (NCHS), CDC.

<sup>†</sup>Includes live births, legally induced abortions, and ectopic pregnancies.

**TABLE 1. Estimated numbers and rates of ectopic pregnancies, by year — United States, 1970–1985**

Year	Number	Rates for:		
		Reported pregnancies*	Live births <sup>†</sup>	Females 15–44 yrs <sup>‡</sup>
1970	17,800	4.5	4.8	4.2
1971	19,300	4.8	5.4	4.4
1972	24,500	6.3	7.5	5.5
1973	25,600	6.8	8.2	5.6
1974	26,400	6.7	8.4	5.7
1975	30,500	7.6	9.8	6.5
1976	34,600	8.3	11.0	7.2
1977	40,700	9.2	12.3	8.3
1978	42,400	9.4	12.8	8.5
1979	49,900	10.4	14.3	9.9
1980	52,200	10.5	14.5	9.9
1981	68,000	13.6	18.7	12.7
1982	61,800	12.3	17.0	11.5
1983	69,600	14.0	19.2	12.6
1984	75,400	14.9	20.6	13.6
1985	78,400	15.2	20.9	14.0
<b>Total</b>	<b>717,100</b>	<b>10.0</b>	<b>13.0</b>	<b>9.0</b>

\*Rate per 1000 reported pregnancies (live births, legally induced abortions, and ectopic pregnancies).

<sup>†</sup>Rate per 1000 live births.

<sup>‡</sup>Rate per 10,000 females.
