MORBIDITY AND MORTALITY WEEKLY REPORT

329 Adolescent Suicide and Suicide Attempts - Santa Fe County, New Mexico, January 1985May 1990
331 Prevalence of Chronic Migraine Headaches - United States, 1980-1989
339 Notices to Readers

## Effectiveness in Disease and Injury Prevention

## Adolescent Suicide and Suicide Attempts Santa Fe County, New Mexico, January 1985-May 1990

In February 1990, a physician notified the Office of Epidemiology, New Mexico Department of Health (NMDH), of a possible cluster of suicides among high school students in Santa Fe County, New Mexico, after two male high school students committed suicide within a 4-day period. Because of concerns by school officials that the number of students attempting suicide in 1990 had increased, the NMDH began an epidemiologic investigation.

In 1989, there were an estimated 13,625 10- to 19 -year-olds in Santa Fe County. Students attended one of three public high schools in the county, and one hospital provided emergency care; an Indian Health Service hospital provided care only to American Indians. A review of vital statistics data indicated that, from 1985 through 1988, three or fewer suicides occurred among 10- to 19-year-olds in the county each year, compared with six in 1989 ( $\mathbf{p}<0.001$, Poisson distribution) (Table 1).

The emergency department (ED) log at the county hospital was reviewed to determine the number of persons $<20$ years of age who were evaluated because of

TABLE 1. Number and method of completed suicides among 10- to 19 -year-old residents, by year - Santa Fe County, New Mexico, January 1985-May 1990

| Year | No. completed suicides | Method of suicide |
| :--- | :---: | :--- |
| 1985 | 1 | Self-inflicted gunshot wound |
| 1986 | 3 | Self-inflicted gunshot wounds |
| 1987 | 0 |  |
| 1988 | 0 | Self-inflicted gunshot wound (4 persons), <br> 1989 |
| 1990 | 6 | drug ingestion (1), motor vehicle exhaust (1) |
|  | 2 | Hanging (1), self-inflicted gunshot wound (1) |

Adolescent Suicide - Continued
a suicide attempt or suicide ideation from January 1, 1986, through May 31, 1990. A case-patient was defined as a Santa Fe County resident $<20$ years of age who had had a physician diagnosis of either suicide attempt/gesture or suicide ideation. Because addresses were not listed in the ED log, county residents were identified by their home telephone number exchanges; persons who did not list a telephone number in the log were excluded from the review.

Two hundred eighteen persons who met the diagnostic criteria were evaluated in the hospital ED. Of these, 53 ( $24 \%$ ) were excluded from the review because they had not listed a home telephone number. Of the 165 case-patients, seven (4\%) had been evaluated twice. Case-patients ranged in age from 10 to 19 years (mean: 16 years); 102 (62\%) were female, and 96 ( $58 \%$ ) were hospitalized. Twenty-one (13\%) were evaluated for suicide ideation, and 144 ( $87 \%$ ) for a suicide attempt/gesture. Of those who had attempted suicide, 117 ( $81 \%$ ) had ingested some type of drug, seven (5\%) had had a self-inflicted laceration, one (1\%) had had a self-inflicted gunshot wound, and one (1\%) had attempted hanging. For 18 (13\%) case-patients, the method of attempt was not specified.

Based on the total number of ED visits, the estimated rate of suicide attempts in February 1990 ( 3.7 per 1000 visits) was greater than the mean rate for February from 1986 through 1989 (1.2 per 1000) ( $p=0.03$, Fisher's exact test) (Figure 1). In addition, for 1986-1989, rates during June, July, and August were consistently lower than during other months.
Reported by: O Long, ED Burk, MD, JR Evaldson, MD, St. Vincent Hospital, Santa Fe; K Siler, MA, D Bianca, Teen Wellness Center, Santa Fe County Public Schools; P Totkamachi, New Mexico Vital Records and Statistics; MM Gallaher, MD, IN Vold, MPH, Office of Epidemiology, CM Sewell, DrPH, State Epidemiologist, New Mexico Dept of Health. Epidemiology Br, Div of Injury Control, Center for Environmental Health and Injury Control, CDC.
Editorial Note: Although suicide clusters have been studied previously (1,2), understanding of the epidemiology of suicide clusters and attempts, and potential risk factors, is limited. For example, because ready access to firearms may contribute to

FIGURE 1. Rate* of suicide attempts among 10- to 19 -year-old residents, by month Santa Fe County, New Mexico, January 1986-May 1990

*Per 1000 visits to the county hospital emergency department.

## Adolescent Suicide - Continued

completed suicides among teenagers, limiting access to firearms may help to reduce the rate of suicides for young persons (3). Among teenagers in Santa Fe County, firearms were used in eight of the 12 completed suicides from January 1985 through May 1990.

Difficulties in ascertaining the true number of suicide attempts are an important barrier to improved understanding of this problem. In Santa Fe County, there were limitations in using the ED log as a means of identifying suicide attempts: only those persons who sought care at the hospital, whose diagnosis fit the case definition, and who provided a home telephone number could be identified. Nonetheless, because mental health referral patterns and diagnosis patterns did not change during the period studied, the changes in the number of persons identified as having attempted suicide probably accurately reflected changes in the true incidence of suicide attempts in Santa Fe County during that period.

Because of the associations between the perception of suicide clusters and additional suicide attempts, communities should respond to an apparent suicide cluster even before confirming the existence of a statistically significant cluster (4). For example, as a result of the perceived cluster of suicides and attempts, Santa Fe County implemented an adolescent suicide prevention program at the two public high schools in the city and used CDC guidelines (5) to organize a community response team. Because rates of suicide attempts are higher among teenagers during the school year, school-based intervention measures may be effective in reducing the number of attempts and completed suicides.

## Current Trends

## Prevalence of Chronic Migraine Headaches United States, 1980-1989

Migraine headaches, which are characterized by painful, disabling, and recurring symptoms, have no known cause, treatment, or cure. Quality population-based data are needed to improve epidemiologic understanding of chronic migraine headaches. This report uses data from the National Health Interview Survey (NHIS) to describe the prevalence of recent trends in the occurrence of chronic migraine headaches in the United States from 1980 through 1989.

Data for the NHIS were collected by CDC's National Center for Health Statistics (NCHS) through personal interviews with a representative sample of the civilian,

*Mortality data in this table are voluntarily reported from 121 cities in the United States, most of which have populations of 100,000 or more. A death is reported by the place of its occurrence and by the week that the death certificate was filed. Fetal deaths are not included.
**Pneumonia and influenza.
$\dagger$ Because of changes in reporting methods in these 3 Pennsylvania cities, these numbers are partial counts for the current week. Complete counts will be available in 4 to 6 weeks.
ttTotal includes unknown ages.
\$Report for this week is unavailable (U).

## Migraine Headaches - Continued

noninstitutionalized U.S. population. Information regarding chronic migraine headaches was obtained through a checklist of medical conditions (i.e., the respondent answered "yes" to the question, "During the past 12 months, did anyone in the family have [a] migraine headache?") or from reports of migraine headaches that restricted or limited activity or resulted in hospitalization. For the 10 -year period, sample sizes ranged from approximately 60,000 to 125,000 persons. The data for 1980 are annual averages based on data from 1979 through 1981.

From 1980 through 1989, the prevalence of chronic migraine headaches in the United States increased nearly 60\%, from 25.8 per 1000 persons (1) to 41.0 per 1000 persons (Table 1). Most ( $71 \%$ ) of the increase occurred among persons $<45$ years of age. Because of sampling variability, differences between estimates based on single years of data may not be statistically significant, but comparisons between the 3-year averages for 1979-1981 (1) and 1986-1988 (NCHS, unpublished data) indicate a more than $40 \%$ increase in the prevalence of migraine headaches, from 25.8 to 36.7 per 1000 population.

In each year, the prevalence of migraine headaches was greater among women than men in each age group (Table 1). In addition, the rate of change was greater among women: from 1980 through 1989, the prevalence among women $<45$ years of age increased 77\%, compared with a 64\% increase among men.

The 3-year annual average of data from 1986 through 1988 showed that more than $80 \%$ of women and $70 \%$ of men reporting chronic migraine headaches had at least one physician contact per year because of migraine headaches; $8 \%$ and $7 \%$ of women and men, respectively, were hospitalized at least once a year because of the condition (NCHS, unpublished data). In addition, chronic migraine headaches had a substantial impact on functional capacity: $4 \%$ of men and $3 \%$ of women reported a chronic limitation in normal activity because of migraine headaches and associated symptoms.

In 1989, the prevalence of migraine headaches was highest in the western United States ( 45.4 per 1000 persons). In comparison, rates in the south and midwest were 41.0 and 40.4, respectively; rates were lowest in the northeast ( 36.9 per 1000). In addition, during 1986-1988, within each age group the prevalence of chronic migraine headaches was highest in the west and lowest in the northeast (Figure 1).

TABLE 1. Prevalence* of chronic migraine headaches per year, by patient sex and age - United States, 1980 and 1982-1989 ${ }^{\dagger}$

| Sex/Age (yrs) | $1980^{5}$ | 1982 | 1983 | 1984 | 1985 | 1986 | 1987 | 1988 | 1989 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Male |  |  |  |  |  |  |  |  |  |
| $<45$ | 14.4 | 17.0 | 15.2 | 20.3 | 19.5 | 18.1 | 18.5 | 24.0 | 23.6 |
| $45-64$ | 14.9 | 23.7 | 22.0 | 23.8 | 18.7 | 25.0 | 22.9 | 20.8 | 24.8 |
| $\quad \geqslant 65$ | 7.6 | 13.4 | 7.8 | 3.3 | 13.4 | 4.8 | 7.3 | 8.8 | 17.5 |
| Female |  |  |  |  |  |  |  |  |  |
| $<45$ | 33.3 | 45.6 | 46.7 | 47.0 | 54.9 | 53.7 | 54.5 | 55.4 | 58.9 |
| $45-64$ | 55.8 | 73.5 | 61.0 | 55.1 | 61.6 | 64.2 | 66.6 | 67.9 | 75.5 |
| $\quad \geqslant 65$ | 23.1 | 23.3 | 23.2 | 25.8 | 17.8 | 32.1 | 21.5 | 25.3 | 26.5 |
| Total | 25.8 | 33.6 | 31.6 | 33.0 | 35.6 | 36.0 | 35.8 | 38.3 | 41.0 |

[^1]${ }^{\dagger} 95 \%$ confidence interval for $1980= \pm 1.8$; for $1982-1985$ and 1987-1989, 2.7-3.4; and for 1986, $\pm 4$. .
${ }^{5}$ Estimates for 1980 are averages based on data years 1979-1981.

## Migraine Headaches - Continued

Reported by: Illness Disability Statistics Br, Div of Health Interview Statistics, and National Ambulatory Medical Care Survey, Div of Health Care Statistics, National Center for Health Statistics, CDC.
Editorial Note: Chronic migraine headaches are classified either as "common" or "classical." Manifestations of the common migraine headache include nausea, dizziness, fever, and general malaise. The classical migraine headache is most noted for an aura that immediately precedes the headache. In addition, the classical migraine headache is characterized by a relatively short duration ( $\leqslant 12$ hours) compared with the common migraine headache (up to 4 days) (2).

Although epidemiologic and clinical studies have not clearly defined the etiology. of chronic migraine headaches, potential risk factors include diet, allergy, air quality, and stress $(3,4)$. Reasons for the variations in prevalence of chronic migraine headaches by region are unclear but may reflect differences in the prevalence of risk factors, diagnostic practices, or the reporting behavior of NHIS respondents.

NHIS data on migraine headaches are collected on an ongoing basis using a standardized questionnaire and may be used as a source for surveillance of this problem. Both the increase of chronic migraine headache prevalence and the high level of medical care use and extensive disability (reflected by days of restricted activity) for this poorly understood condition suggest the need for further investigation of etiology and the need for improved treatment to ameliorate or reduce the disability.

## Publication of Annual Report on the Nation's Health

CDC's National Center for Health Statistics has issued Health, United States, 1990. The report includes a chartbook section on minority health, with detailed racial/ethnic data on major health indicators and a review of the health of and health care for the nation. The report also provides data on a wide range of health measures. Specific findings include generally lower levels of health and health care among blacks, American Indians, and Puerto Ricans, as well as better health status and access to health care among whites, Cubans, and Asians.

Health, United States, 1990 is available from the Superintendent of Documents, Government Printing Office (GPO), Washington, DC 20402; telephone (202) 783-3238; stock no. 017-022; price $\$ 18.00$. Tables from the report are available on diskette in spread-sheet format to facilitate additional data analysis; for copies of the diskette, contact GPO's Electronic Media Order Desk; telephone (202) 275-0186.

## Publication of Report on Firearm Mortality Among Children, Youth, and Young Adults

CDC's National Center for Health Statistics (NCHS) has released a report that addresses the increasingly high rate of deaths from firearms among children, youth, and young adults. The report, Firearm Mortality Among Children, Youth, and Young Adults 1-34 Years of Age, Trends and Current Status: United States, 1979-88, presents a detailed analysis of trends since 1979 on firearm-attributable homicides, suicides, and unintentional deaths.

Copies of the report are available free of charge from the Scientific and Technical Information Branch, NCHS, CDC, Room 1064, 6525 Belcrest Road, Hyattsville, MD 20782; telephone (301) 436-8500.

## Report on Use of Selected Medical Device Implants

The first national data about the use of selected medical device implants are available from CDC's National Center for Health Statistics (NCHS). The information was collected during 1988 by NCHS' ongoing National Health Interview Survey in collaboration with the Food and Drug Administration's Center for Devices and Radiological Health.

The report provides estimates of the number of persons with implants, types of implants, length of time implants have been in use, implant replacements, and reasons for and problems with implants. Data are presented by patient age, sex, race/ethnicity, family income, poverty status, education, geographic region, place of residence, activity limitation, and respondent-assessed health status.

The report, Use of Medical Device Implants in the United States, 1988, is available free of charge from the Scientific and Technical Information Branch, NCHS, CDC, Room 1064, 6525 Belcrest Road, Hyattsville, MD 20782; telephone (301) 436-8500.

The Morbidity and Mortality Weekly Report is prepared by the Centers for Disease Control, Atlanta, Georgia, and is available on a paid subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, (202) 783-3238.

The data in this report are provisional, based on weekly reports to CDC by state health departments. The reporting week concludes at close of business on Friday; compiled data on a national basis are officially released to the public on the succeeding Friday. Accounts of interesting cases, outbreaks, environmental hazards, or other public health problems of current interest to health officials, as well as matters pertaining to editorial or other textual considerations should be addressed to: Editor, Morbidity and Mortality Weekly Report, Mailstop C-08, Centers for Disease Control, Atlanta, Georgia 30333; telephone (404) 332-4555.
